Key to Symbols

I. Well-known Principles

1	Introduction.....	3
	<i>J.D. Macomber</i>	
1.1	Electric Fields in Atoms and Waves.....	3
1.2	Photoionization and Nonresonant Scattering.....	6
1.3	Resonant Interactions and Spectroscopy.....	9
1.4	The Bouguer-Lambert-Beer Law.....	11
1.5	The Importance of Spectroscopic Transitions.....	13
1.6	The Question of Dynamics.....	15
1.7	Early History of the Quantum Theory.....	16
1.8	Dynamics During Spectroscopic Transitions.....	21
1.9	References.....	25
1.10	Problems.....	25
2	Elementary Quantum Theory.....	26
	<i>J.D. Macomber</i>	
2.1	States and Their Properties: Operators and Kets.....	26
2.2	Stationary States: Eigenkets and Eigenfunctions.....	29
2.3	Schrödinger's Equation: Time Dependence of ψ	33
2.4	Kets and Bras: Orthogonality and Normalization.....	35
2.5	Quantum Systems "in-between" Eigenstates.....	38
2.6	Eigenvalues and Expectation Values.....	42
2.7	Superposed Eigenfunctions and Perturbed Eigenfunctions.....	46
2.8	References.....	49
2.9	Problems.....	49
3	Elementary Electromagnetic Theory.....	51
	<i>J.D. Macomber</i>	
3.1	Relationship Between Classical and Quantum-Mechanical Theories.....	51
3.2	Applicability of Classical and Quantum Theories.....	52
3.3	When the Classical Theory May Be Used.....	53
3.4	Waves and Particles and Their "Sizes".....	54
3.5	Electromagnetic Waves and Quantum Systems: Size Ratios.....	56

3.6	Series Expansions for Electromagnetic Fields	58
3.7	Interactions Between Multipoles and Field Asymmetries	61
3.8	Electromagnetic Waves and Quantum Systems: Interactions	64
3.9	Complex Susceptibilities, Electric and Magnetic	68
3.10	Effect of Susceptibilities on Wave Propagation	71
3.11	Absorption Coefficient and Refractive Index	73
3.12	Phase Relationships: Absorption, Emission, and Dispersion	75
3.13	References	78
3.14	Problems	78
4	Interaction of Radiation and Matter	79
	<i>J.D. Macomber</i>	
4.1	Dipoles and Waves: the Semiclassical Theory	79
4.2	The Transition Dipole Moment of a Hydrogen Atom	80
4.3	Conceptual Problems with the Theory	85
4.4	Quantum Jumps and the Uncertainty Principle	86
4.5	The Spin- $\frac{1}{2}$ System	90
4.6	A Geometrical Model of the Transition Process	93
4.7	Quantum Jumps on the Sphere of Certainty	98
4.8	Magnetic Resonance in Bulk and in Beams	100
4.9	The Stern-Gerlach Experiment	101
4.10	State Selection in Beam Experiments	103
4.11	The Rabi Magnetic Resonance Experiment	105
4.12	The Ramsey Separated Oscillating Fields Experiment	107
4.13	A Thought Experiment	108
4.14	Difficulties with the Proposed Experiment	112
4.15	The Bloom Transverse Stern-Gerlach Effect	113
4.16	Quantum Jumps and Superposition States: Conclusion	114
4.17	References	117
4.18	Problems	117

II. Quantum Statistics

5	Ensembles of Radiating Systems	121
	<i>J.D. Macomber</i>	
5.1	Reasons for the Use of Statistical Methods	121
5.2	Coherent and Incoherent Perturbations	122
5.3	Strongly Coupled and Weakly Coupled Systems	123
5.4	Computing Expectation Values from Superposition Coefficients .	125
5.5	Equations of Motion for the Operator D	128
5.6	The Density Operator	130
5.7	Properties of the Density Matrix	132
5.8	Effect of Relaxation on the Density Matrix	134
5.9	Equations of Motion for the Density Matrix	135
5.10	Coherence in Ensembles of Quantum Radiators	137
5.11	Creating, Observing, and Destroying Coherence	142

5.12	References	146
5.13	Problems	146
6	Relaxation Processes and Coherent Dissipative Structures.....	148
	<i>E. Brändas</i>	
6.1	Dissipative Systems.....	148
6.2	Entanglement and Interference Effects.....	150
6.3	The Ensemble for an Ideal System.....	152
6.4	The Density Matrix	156
6.5	Variational Principles and the Negentropy	158
6.6	The Extreme Case.....	160
6.7	Resonance Picture of Unstable States	169
6.8	Resonances and Dissipative Dynamics	180
6.9	The Coherent-Dissipative Ensemble.....	185
6.10	References	192
6.11	Problems	193
7	Applications of CSM Theory	194
	<i>E. Brändas</i>	
7.1	Occurrence of Coherent-Dissipative Structures.....	194
7.2	Proton Transfer Processes in Water and Aqueous Solutions	196
7.3	The Development of ODLRO and the Phases of High-Temperature Superconductors	204
7.4	Fractional Statistics in the Quantum Hall Effect	216
7.4.1	The Fractional QHE	217
7.4.2	Quantum States.....	219
7.4.3	The Many-Body System	220
7.4.4	High Correlation.....	222
7.4.5	Wigner Solids.....	223
7.5	Spontaneous and Stimulated Emission of Radiation in Masers ..	226
7.5.1	Einstein Relation.....	226
7.5.2	Cyclotron Maser Concept.....	227
7.5.3	Liouville Formulation of CMC.....	230
7.5.4	Self-Organization.....	233
7.5.5	Connection with the Gainfunction	235
7.5.6	Conclusion	237
7.6	Final Conclusions.....	238
7.7	References	240
7.8	Problems	242

III. Gyating Dipole Moments

8	Basic Principles of Magnetic Resonance.....	245
	<i>J.D. Macomber</i>	
8.1	Operators Representing Orbital Angular Momentum.....	245
8.2	Operators Representing Spin Angular Momentum	248
8.3	Eigenkets of Spin; Raising and Lowering Operators	250

8.4	Number of States, Normalization, and Eigenvalues	254
8.5	Spinning Particles in Nature	257
8.6	The Effect of a Static Magnetic Field	261
8.7	The Effect of an Oscillating Magnetic Field.....	265
8.8	The Density Matrix for Magnetic Resonance	268
8.9	The Ensemble-Averaged Magnetization	272
8.10	Solutions to the Bloch Equations.....	275
8.11	Absorption and Stimulated Emission: Free-Induction Decay	279
8.12	The Crossed-Coil Nuclear Magnetic Resonance Spectrometer ...	284
8.13	Steady-State Magnetization: Curie's Law	287
8.14	Conventional Nuclear Magnetic Resonance Spectroscopy: Slow Passage	290
8.15	Equivalence of Transient and Steady-State Methods.....	294
8.16	Spin Echoes	295
8.17	References	303
8.18	Problems	304
9	Spin Dynamics and Radical Reactions	305
	<i>M. Goez</i>	
	Key to Symbols	305
9.1	Molecules in Doublet States.....	306
9.2	Singlet and Triplet States	309
9.3	Intersystem Crossing by Magnetic Interactions	314
9.4	Spin Dynamics of Radical Pairs in High Fields	322
9.5	Combining Spin Dynamics and Radical Pair Dynamics.....	328
9.6	Chemically Induced Nuclear Spin Polarizations.....	335
9.7	Chemically Induced Electron Spin Polarizations	351
9.8	Quantum Beats	354
9.9	References	356
9.10	Problems	357
10	Generalization of the Gyroscopic Model	358
	<i>J.D. Macomber</i>	
10.1	The Gyroscopic Model of the Interaction Process.....	358
10.2	Electric-Dipole-Allowed Transitions.....	361
10.3	Relaxation and Its Effect on Line Widths.....	366
10.4	Phase Interruption and Pressure Broadening	368
10.5	Other Relaxation Processes in Gases and Solids	372
10.6	Optical Analogs to Magnetic Resonance Phenomena.....	374
10.7	Photon Echoes: Qualitative Discussion.....	379
10.8	Angle of Echo Propagation Using the Gyroscopic Model.....	381
10.9	Mathematical Analysis of $\pi/2$, π Echoes.....	386
10.10	Self-Induced Transparency: Qualitative Discussion	389
10.11	Other Coherent Transient Phenomena	393
10.12	References	396
10.13	Problems	397

IV. Applications of LASER and SR Techniques

11	Stimulated Scattering: Third Order Processes.....	401
	<i>M. Pfeiffer and A. Lau</i>	
11.1	Coherent Material Excitation	401
11.2	Theoretical Background of Four Wave Mixing (FWM).....	404
11.2.1	Extension of the Applicability of the Raman FWM-Equations and the Method of Their Solution	406
11.2.2	FWM Under Steady State Conditions	407
11.2.3	FWM Under Stationary Conditions	407
11.2.4	The Notation of Nonlinear Susceptibility.....	408
11.3	Coherent Antistokes Raman Spectroscopy.....	410
11.3.1	Determination of Nonlinear Susceptibilities by CARS Line Shape Analysis	410
11.3.2	Application of Special Polarization Arrangements to Discriminate Between Different Contributions to the CARS Signal.....	414
11.3.3	Background Suppression by Suitably Chosen Field Polarizations	416
11.4	Nonlinear Polarization Spectroscopy.....	418
11.4.1	Pressure-Induced FWM Signals	421
11.5	Time-Resolved Techniques of FWM	422
11.5.1	Characteristic Experimental Results.....	423
11.5.2	Increased Spectral Resolution Applying Specially Designed Pulsed FWM Techniques.....	430
11.5.3	Photon Echoes of Polyatomic Molecules in Condensed Phases..	432
11.6	Time-Resolved Measurements with Incoherent Laser Beams Bearing ps- and Sub-ps-Fluctuations.....	434
11.6.1	CSRS with Incoherent Laser Light.....	436
11.6.2	White-Detector Limit.....	437
11.6.3	Spectrally Resolved Detection	439
11.6.4	Some Experimental Results	441
11.7	Material Excitation by SRS for a Frequency Modulated Statistically Fluctuating Laser	444
11.8	The Description of Molecular Susceptibilities by Feynman Diagrams.....	446
11.8.1	Rules for Deriving the $\chi^{(n)}$ -Expressions from the Diagrams.....	447
11.8.2	The General Form of the $\chi^{(3)}$ -Susceptibility Expression	448
11.8.3	Term Selection Under Resonance Excitation.....	450
11.8.4	Determination of Molecular Polarizations by the Feynman Diagram Technique in the Case of Time Dependent Fields.....	451
11.9	References	453
11.10	Problems	454

12	Transient Grating Spectroscopy	456
	<i>F.-W. Deeg</i>	
	Key to Symbols	456
12.1	Transient Grating and Four-Wave Interaction	458
12.2	Grating Excitation Mechanisms	464
12.3	Diffraction at a Grating	469
12.4	Characteristics of the Transient Grating Technique	474
12.5	Depopulation and Orientation Processes	478
12.6	Electronic Energy Transfer and Charge Carrier Dynamics	484
12.7	Mass and Heat Diffusion	489
12.8	Propagation of Ultrasonic Waves and Structural Relaxation	497
12.9	References	503
12.10	Problems	504
13	Synchrotron Radiation and Free Electron Lasers	506
	<i>M. Watanabe and G. Isoyama</i>	
13.1	Introduction	506
13.2	Synchrotron Radiation	509
13.3	Undulator Radiation	516
13.4	Free Electron Lasers	522
13.5	Accelerators for Light Sources and Undulators	529
13.6	VUV Optical Components	537
13.7	VUV Monochromators	546
13.8	Techniques for VUV Measurements	554
13.9	Far Infrared Instrumentation	560
13.10	Two-Color Experiments	564
13.11	References	566
13.12	Problems	567
	Subject Index	569
