Foreword — V

About the authors — XI

About the translators — XIII

Chapter 6

Change from liquid or vapor phase to solid phase for one-component system — 1

- 6.1 Phase equilibria and thermodynamics of phase transformation — 1
 - 6.1.1 Phase rule — 1
 - 6.1.2 One-component phase diagrams — 2
- 6.2 Solidification of single component — 4
 - 6.2.1 Structure of melt — 4
 - 6.2.2 Free energy change during solidification — 5
 - 6.2.3 Nucleation — 7
 - 6.2.4 Crystal growth — 16
 - 6.2.5 Crystallization kinetics and solidified microstructures — 22
 - 6.2.6 Structural modification and innovative technology — 29
- 6.3 Vapor–solid phase transformation and growth of thin films — 34
 - 6.3.1 Vapor pressure — 34
 - 6.3.2 Thermodynamic conditions of evaporation and condensation — 37
 - 6.3.3 Mean free path of gaseous molecules — 37
 - 6.3.4 Nucleation — 39
 - 6.3.5 Growth modes of thin films — 39
 - 6.3.6 Application examples (giant magnetoresistance of multilayer and granular films) — 41
- 6.4 Crystallization characteristics of polymers — 42

Chapter 7

Binary phase diagrams and solidification of alloys — 51

- 7.1 Representation and determination method of phase diagram — 51
- 7.2 Essentials of phase diagram thermodynamics — 54
 - 7.2.1 Free energy–composition curve of solid solution — 55
 - 7.2.2 The principle of common tangent of multiphase equilibrium — 56
 - 7.2.3 Free energy and lever rule of mixture — 57
 - 7.2.4 Phase diagram deduced from the free energy–composition curve — 59
 - 7.2.5 Geometric rules of binary phase diagram — 59

7.2.6	Calculation of phase diagram —	61
7.3	Binary phase diagram —	62
7.3.1	Isomorphous phase diagram and solidification of solid solution —	62
7.3.2	Eutectic phase diagram and solidification of alloys —	69
7.3.3	Peritectic phase diagram and solidification of alloys —	78
7.3.4	Miscibility gap phase diagram and spinodal decomposition —	83
7.3.5	Binary phase diagrams of other forms —	84
7.3.6	Analysis of complicated binary phase diagram —	92
7.3.7	Alloy properties deduced from phase diagrams —	94
7.3.8	Examples of binary phase diagrams —	97
7.4	Solidification theory of binary alloys —	112
7.4.1	Solidification theory of solid solution alloys —	112
7.4.2	Solidification theory of eutectics —	130
7.4.3	The structure and defects of alloy castings (ingots) —	143
7.4.4	Casting and secondary processing of alloys —	152
7.5	Brief introduction to polymer alloys —	154
7.5.1	Compatibility of polymer alloy —	154
7.5.2	Phase diagram of polymer system and its measurement —	156
7.5.3	Preparation of polymer alloys —	158
7.5.4	Morphological structure of polymer alloy —	167
7.5.5	The general relationship between properties and components in polymer alloys —	171
7.5.6	The main types of polymers and their alloys —	172
7.6	Brief introduction of ceramic alloys —	175
7.6.1	Synthesis of ceramic alloys —	175
7.6.2	Forming and sintering of ceramic powder —	178
7.6.3	Preparation of glass —	178
7.6.4	Properties of ceramic materials —	181
 Chapter 8		
Ternary phase diagrams — 185		
8.1	The basics of ternary phase diagrams —	185
8.1.1	Representation of components in ternary phase diagrams —	186
8.1.2	The space pattern of ternary phase diagrams —	189
8.1.3	Sections and projection drawings of ternary phase diagrams —	191
8.1.4	Lever rule and barycenter rule in ternary phase diagrams —	193
8.1.5	Analysis of equilibrium crystallization process of isomorphous phase diagrams —	196
8.2	Ternary eutectic phase diagrams with insoluble components —	197
8.3	Ternary eutectic phase diagrams with limited solid solubility —	204

- 8.4 Ternary phase diagrams consisting of two binary eutectic systems and one binary isomorphous system — 210
- 8.5 Ternary quasi-peritectic phase diagrams — 212
- 8.6 Ternary phase diagrams with four-phase equilibrium peritectic transformation — 214
- 8.7 Ternary phase diagrams with stable compound — 216
- 8.8 Examples of ternary phase diagrams — 218
- 8.9 Summary of ternary diagram — 228

Chapter 9

Foundation of solid phase transformation — 234

- 9.1 Introduction of solid-state phase transformation in metal — 234
 - 9.1.1 Main classification — 234
 - 9.1.2 The main characteristics of phase transformation in solids — 240
- 9.2 Thermodynamics of solid phase transformation — 247
 - 9.2.1 Thermodynamic condition of solid phase transformation — 247
 - 9.2.2 Nucleation of solid phase transformation — 250
 - 9.2.3 Nucleus growth of solid phase transformation — 257
- 9.3 Phase transformation macro kinetic equation — 264
- 9.4 Phase transformation kinetic curve — 264

Chapter 10

Functional properties of materials — 266

- 10.1 Introduction to physical basis of functional materials — 266
 - 10.1.1 Energy band — 266
 - 10.1.2 Fermi energy — 267
- 10.2 Electrical property — 268
 - 10.2.1 Description of electrical property — 268
 - 10.2.2 The conductivity based on the energy band theory — 270
 - 10.2.3 Electron mobility — 271
 - 10.2.4 The electrical resistivity of metal — 272
 - 10.2.5 The electrical conductivity of intrinsic and extrinsic semiconductor — 273
 - 10.2.6 Electrical conductivity and dielectricity of insulator — 278
- 10.3 Thermal behavior — 282
 - 10.3.1 Heat capacity — 282
 - 10.3.2 Thermal expansion — 284
 - 10.3.3 Heat conduction — 286
 - 10.3.4 Thermal stress — 288
- 10.4 Magnetic performance — 289
 - 10.4.1 Representation of magnetic property — 289
 - 10.4.2 Origin of magnetic moment — 291

10.4.3	Classification of magnetism —	292
10.4.4	Domain and hysteresis —	297
10.4.5	Soft magnetic and hard magnetic materials —	300
10.5	Optical performance —	301
10.5.1	Electromagnetic radiation —	301
10.5.2	Interaction between light and solid —	303
10.5.3	Interaction between atoms and electrons —	303
10.5.4	Refraction —	306
10.5.5	Reflection —	307
10.5.6	Absorption —	308
10.5.7	Transmission —	311
10.5.8	Color —	312
10.5.9	Stimulated emission and light amplification —	313
10.6	Other functional properties —	315
10.6.1	Internal friction and damping behavior —	315
10.6.2	Piezoelectricity —	321
10.6.3	Magnetostriction —	327
