Prologue	1
I. Introduction	5
1. Observables as POV Measures	5
1.1. Statistical Analysis of an Experiment	5
1.2. POV Measures Arising from Actual Measurements	7
1.3. Conceptual Problems Requiring POV Measures	12
1.4. New Possibilities Envisaged with POV Measures	16
2. Historical Survey	17
II. Theory	19
1. Hilbert Space Frame	19
1.1. Preliminaries	19
1.2. States and Observables	23
2. Physical and Mathematical Features of POV Measures	25
2.1. Unsharp Properties	25
2.2. Coexistence	26
2.3. Constructing POV Measures from PV Measures	29
2.4. Neumark's Theorem	31
2.5. Symmetric Operators and Contractions	32
3. Quantum Measurement Theory	34
3.1. Operations	35
3.2. State Transformers	37
3.3. Measurements	39
3.4. The Standard Model	42
3.5. Repeatable Measurements	44
4. Individual Interpretation of Quantum Mechanics	46
III. Observables	49
1. Observables as Covariant Objects	50
2. Position and Momentum	53
2.1. Covariance Properties	53
2.2. Sharp Position and Momentum	55
2.3. Unsharp Position and Momentum	59
2.4. Phase Space Observables	60

3.	Angular Momentum and Angle	65
3.1.	Covariance Properties	65
3.2.	Orbital Angular Momentum	67
3.3.	Spin	70
3.4.	Angle Observables	73
4.	Energy and Time	77
4.1.	Energy	78
4.2.	Time	79
5.	Photon Observables	82
5.1.	Photon Number and Phase	82
5.2.	Joint Observables for the Quadrature Components	88
5.3.	Photon Localisation	92
IV.	Measurements	95
1.	Continuous Observables	95
2.	Pairs of Observables	101
2.1.	Coexistent Observables	101
2.2.	Examples	102
2.3.	Complementary Observables	104
2.4.	Coupling Properties of Position and Momentum	107
2.5.	The Heisenberg Interpretation of the Uncertainty Relations	108
2.6.	Coexistence of Complementary Spin Observables	109
3.	Measurements and Conservation Laws	110
3.1.	Repeatable Measurements and Conservation Laws	111
3.2.	Spin Measurements and Rotation Invariance	112
3.3.	Position Measurements and Momentum Conservation	114
V.	Uncertainty	117
1.	Coarse-Graining	118
2.	Informational Completeness	120
3.	Unsharpness	124
3.1.	Quantum Indeterminism and Classicality Conditions	124
3.2.	Measurement: Disturbance Versus Information Gain	127
3.3.	Unsharpness in Phase Space Inference	128
3.4.	Impossibility of Individual State Determination	131
4.	Uncertainty Relations	134
4.1.	Variance	134
4.2.	Alternative Measures of Uncertainty	137
4.3.	Entropy	139

VI. Phase Space	145
1. Representations of States as Phase Space Functions	145
2. Joint Position-Momentum Measurement	150
2.1. The Model	151
2.2. Indeterminacy Relations	152
2.3. Mutual Disturbance	154
2.4. Repeatability Features	155
3. Classical Limit	156
3.1. Classical Measurement Situation	156
3.2. Approximately Ideal Measurements	159
VII. Experiments	165
1. Stern-Gerlach Experiment	165
1.1. Ideal Field	167
1.2. Realistic Magnetic Field	171
1.3. Proper Screen Observables	173
2. Informationally Complete Polarisation Measurement	174
3. Measurement Schemes Involving Photons	177
3.1. Photon Counting and a Lossless Beam Splitter	177
3.2. First Kind Measurements of the Photon Number	180
3.3. Measurement of the Photon Number in a Microwave Cavity	186
3.4. Phase Distributions from Number Statistics	189
3.5. Nondegenerate Amplification and Two-Mode Squeezing	191
3.6. Homodyne Detection	192
3.7. Joint Measurement of the Quadrature Components	195
3.8. Atomic Position Measurement	197
4. Wave-Particle Duality of Photons	199
4.1. Photon Split-Beam Experiments	200
4.2. Joint Path-Interference Measurements for Single Photons	206
Epilogue	213
References	215
Notations	225
Subject Index	227
