Preface — VII

Abbreviations — XV

Part I: Fundamentals of optics and quantum optics for single- and entangled photon sources

1 Chaotic light and correlation functions — 3

- 1.1 Introductory remarks — 3
- 1.2 Model: chaotic light — 3
 - 1.2.1 Homogeneous broadening — 3
 - 1.2.2 Inhomogeneous broadening — 5
- 1.3 First-order coherence $g^{(1)}(\tau)$ and temporal field correlations — 6
- 1.4 Michelson interferometry and $g^{(1)}(\tau)$ -measurement — 10
- 1.5 Second-order coherence $g^{(2)}(\tau)$ and intensity fluctuations — 13
- 1.6 Hanbury Brown–Twiss interferometer and $g^{(2)}(\tau)$ -measurement — 17
- 1.7 Summary — 18

2 Quantum theory of radiation — 20

- 2.1 Introductory remarks — 20
- 2.2 Classical theory of the electromagnetic field — 20
- 2.3 Field quantization in open space — 24
- 2.4 Field quantization in a cavity — 27
- 2.5 Quantized correlation functions — 29
- 2.6 Photon density of states — 30
- 2.7 Summary — 32

3 Classification of light states and photon statistics — 33

- 3.1 Introductory remarks — 33
- 3.2 Thermal light states — 33
- 3.3 Coherent states (Glauber states) — 37
- 3.4 Photon number states (Fock states) — 39
- 3.5 Distinction between classical and nonclassical lights — 40
- 3.6 Vacuum field fluctuations — 43
- 3.7 Summary — 44

4	Quantum optics with photon number states — 46
4.1	Introductory remarks — 46
4.2	Single- and two-photon interference at the beamsplitter — 46
4.3	Time-dependent light fields and wavepacket description — 49
4.4	Hong–Ou–Mandel effect with single-photon wavepackets — 53
4.5	Summary — 57
5	Single photons from single emitters: properties and their experimental characterization — 58
5.1	Introductory remarks — 58
5.2	Properties of single emitters — 58
5.2.1	Electronic states: photoluminescence (PL), micro-PL spectroscopy, and photoluminescence excitation — 58
5.2.2	Transition linewidth: Fabry–Perot interferometry — 64
5.2.3	Transition lifetime: time-resolved spectroscopy — 68
5.2.4	Brightness: photon counting — 71
5.2.5	Single-photon purity: photon autocorrelation measurements — 77
5.2.6	Photon coherence: Michelson interferometry — 84
5.2.7	Spectral diffusion: photon-correlation Fourier spectroscopy — 87
5.2.8	Indistinguishability: two-photon interference measurements — 97
5.2.9	Entangled photons properties of real emitters — 109
5.3	Summary — 125
6	Cavity quantum electrodynamics — 127
6.1	Introductory remarks — 127
6.2	A two-level system and a monochromatic field — 127
6.3	The Jaynes–Cummings model — 131
6.4	Two-level system in a cavity in the presence of dissipation – the Purcell effect — 136
6.5	Summary — 140

Part II: Physics of semiconductor quantum dots

7	Basic physical properties of quantum dots — 145
7.1	Introduction — 145
7.2	Electronic properties and carrier confinement — 145
7.2.1	Single-particle states in a harmonic potential — 148
7.2.2	Total angular momentum of electronic states in bulk material — 150
7.2.3	Total angular momentum of electronic states in a quantum dot — 151
7.2.4	Interband optical transition and selection rules in single quantum dots — 152

7.2.5	Coulomb interaction between charge carriers —	153
7.3	Excitonic states in quantum dots and quantum light generation —	155
7.3.1	Neutral exciton and single-photon generation —	156
7.3.2	Neutral biexciton and entangled photon-pair generation —	159
7.3.3	Limitations on photon indistinguishability from cascaded emissions —	165
7.3.4	Limitations on photon purity from the finite pulse length of a resonant excitation laser —	166
7.3.5	Trion and the generation of spin-photon entanglement —	169
7.3.6	Trion and the generation of a photon cluster state —	172
7.4	Summary —	174
8	Environmental influences on the physical properties of quantum dots —	177
8.1	Introduction —	177
8.2	Phonon effects —	177
8.3	Linewidth broadening, dephasing, and spectral diffusion —	184
8.4	Nonradiative recombination, carrier traps, and blinking —	192
8.5	Nonresonant quantum dot-cavity coupling —	197
8.6	High-temperature operation of quantum dot single-photon sources —	200
8.7	Summary —	204
9	Tuning the physical properties of quantum dots —	206
9.1	Introduction —	206
9.2	Tuning by temperature —	206
9.3	Applying electric fields – the quantum-confined Stark effect —	207
9.4	Charge controllable samples —	210
9.5	Applying magnetic fields – the Zeeman effect —	213
9.6	Applying strain fields —	215
9.7	Permanent tuning methods —	224
9.8	Summary —	227
10	Optical and electrical excitation methods of quantum dots —	228
10.1	Introduction —	228
10.2	Optical excitation schemes —	228
10.2.1	Nonresonant optical excitation —	229
10.2.2	Quasi-resonant optical excitation —	231
10.2.3	Resonant optical excitation —	231
10.2.3.1	π -pulse excitation —	232
10.2.3.2	Adiabatic rapid passage —	236
10.2.3.3	Spontaneous spin-flip Raman transitions —	238
10.2.3.4	Two-photon biexciton excitation —	240
10.2.4	Phonon-assisted excitation methods —	241

- 10.2.4.1 Phonon-assisted exciton excitation — **242**
- 10.2.4.2 Phonon-assisted biexciton excitation — **243**
- 10.3 Electrical excitation schemes — **245**
- 10.4 Summary — **249**
- 11 Photon indistinguishability and two-photon interference — 251**
 - 11.1 Introduction — **251**
 - 11.2 Wave-packet description for quantum dot-emitted single photons — **252**
 - 11.3 Two-photon interference of photons from remote sources — **253**
 - 11.4 Two-photon interference of photons from one and the same source — **258**
 - 11.5 Summary — **262**

Part III: Technologies and devices

- 12 Fabrication of QDs and nanofabrication methods — 265**
 - 12.1 Introduction — **265**
 - 12.2 Epitaxial growth of semiconductors — **265**
 - 12.3 Lithography: optical, electron-beam, and deterministic techniques — **268**
 - 12.3.1 Resists, spin-coating, exposure, and development — **268**
 - 12.3.2 Etching: RIE and ICP-RIE — **272**
 - 12.3.3 Dielectric material and metal deposition — **274**
 - 12.3.4 Flip-chip and transfer — **276**
 - 12.3.5 Deterministic lithography — **277**
 - 12.4 Summary — **286**
- 13 Semiconductor cavities and light extraction methods — 288**
 - 13.1 Introductory remarks — **288**
 - 13.2 Geometrical effects — **290**
 - 13.3 Cavity quantum electrodynamics: resonators and photonic crystals — **292**
 - 13.4 Characterizing photonic cavities: micro-PL, reflectivity, resonant scattering — **303**
 - 13.5 Summary — **307**
- 14 Single- and entangled-photon sources, integrated quantum photonics — 309**
 - 14.1 Introduction — **309**
 - 14.2 Single-photon sources — **310**
 - 14.2.1 Micropillar cavity-based sources — **310**
 - 14.2.2 Circular Bragg grating cavity-based sources — **316**
 - 14.2.3 Photonic crystal cavity-based sources — **320**
 - 14.2.4 Open tunable Fabry–Perot cavity-based sources — **321**

14.2.5	Geometrical effects-based sources —	322
14.2.6	Waveguide-based sources for off-chip operation —	323
14.3	Entangled-photon sources —	325
14.3.1	Circular Bragg grating cavity-based sources —	325
14.3.2	Coupled cavities-based sources —	327
14.3.3	Electrically pumped diode-based sources —	328
14.3.4	Geometrical effect-based sources —	329
14.4	Integrated quantum photonics —	329
14.4.1	Waveguides —	330
14.4.2	Waveguide-based single-photon sources: Fabry–Perot resonators —	332
14.4.3	Waveguide-based single-photon sources: photonic crystal waveguides —	332
14.4.4	Beamsplitters —	334
14.4.5	Phase shifters —	335
14.4.6	Single-photon detectors —	336
14.5	Quantum dot emitters: properties in a nutshell —	339
14.6	Summary —	339

Bibliography — 341

Index — 355
