Preface — V

1	Introduction: What are Wilson lines? — 1
2	Prolegomena to the mathematical theory of Wilson lines — 6
2.1	Shuffle algebra and the idea of algebraic paths — 7
2.1.1	Shuffle algebra: Definition and properties — 7
2.1.2	Chen's algebraic paths — 22
2.1.3	Chen iterated integrals — 41
2.2	Gauge fields as connections on a principal bundle — 48
2.2.1	Principal fiber bundle, sections and associated vector bundle — 48
2.2.2	Gauge field as a connection — 53
2.2.3	Horizontal lift and parallel transport — 59
2.3	Solving matrix differential equations: Chen iterated integrals — 61
2.3.1	Derivatives of a matrix function — 61
2.3.2	Product integral of a matrix function — 63
2.3.3	Continuity of matrix functions — 66
2.3.4	Iterated integrals and path ordering — 67
2.4	Wilson lines, parallel transport and covariant derivative — 70
2.4.1	Parallel transport and Wilson lines — 70
2.4.2	Holonomy, curvature and the Ambrose–Singer theorem — 71
2.5	Generalization of manifolds and derivatives — 76
2.5.1	Manifold: Fréchet derivative and Banach manifold — 77
2.5.2	Fréchet manifold — 82
3	The group of generalized loops and its Lie algebra — 86
3.1	Introduction — 86
3.2	The shuffle algebra over $\Omega = \bigwedge M$ as a Hopf algebra — 86
3.3	The group of loops — 94
3.4	The group of generalized loops — 94
3.5	Generalized loops and the Ambrose–Singer theorem — 100
3.6	The Lie algebra of the group of the generalized loops — 101
4	Shape variations in the loop space — 108
4.1	Path derivatives — 108
4.2	Area derivative — 116
4.3	Variational calculus — 127
4.4	Fréchet derivative in a generalized loop space — 130

5 Wilson lines in high-energy QCD — 137

- 5.1 Eikonal approximation — 137
 - 5.1.1 Wilson line on a linear path — 137
 - 5.1.2 Wilson line as an eikonal line — 146
- 5.2 Deep inelastic scattering — 148
 - 5.2.1 Kinematics — 149
 - 5.2.2 Invitation: the free parton model — 150
 - 5.2.3 A more formal approach — 152
 - 5.2.4 Parton distribution functions — 160
 - 5.2.5 Operator definition for PDFs — 163
 - 5.2.6 Gauge invariant operator definition — 165
 - 5.2.7 Collinear factorization and evolution of PDFs — 169
- 5.3 Semi-inclusive deep inelastic scattering — 176
 - 5.3.1 Conventions and kinematics — 176
 - 5.3.2 Structure functions — 178
 - 5.3.3 Transverse momentum dependent PDFs — 180
 - 5.3.4 Gauge-invariant definition for TMDs — 183

A Mathematical vocabulary — 187

- A.1 General topology — 187
- A.2 Topology and basis — 188
- A.3 Continuity — 193
- A.4 Connectedness — 195
- A.5 Local connectedness and local path-connectedness — 198
- A.6 Compactness — 199
- A.7 Countability axioms and Baire theorem — 203
- A.8 Convergence — 205
- A.9 Separation properties — 207
- A.10 Local compactness and compactification — 209
- A.11 Quotient topology — 210
- A.12 Fundamental group — 212
- A.13 Manifolds — 216
- A.14 Differential calculus — 219
- A.15 Stokes' theorem — 224
- A.16 Algebra: Rings and modules — 225
- A.17 Algebra: Ideals — 228
- A.18 Algebras — 229
- A.19 Hopf algebra — 231
- A.20 Topological, C^* -, and Banach algebras — 240
- A.21 Nuclear multiplicative convex Hausdorff algebras and the Gel'fand spectrum — 241

B Notations and conventions in quantum field theory — 249

- B.1 Vectors and tensors — **249**
- B.2 Spinors and gamma matrices — **250**
- B.3 Light-cone coordinates — **252**
- B.4 Fourier transforms and distributions — **254**
- B.5 Feynman rules for QCD — **255**

C Color algebra — 257

- C.1 Basics — **257**
 - C.1.1 Representations — **257**
 - C.1.2 Properties — **257**
- C.2 Advanced topics — **259**
 - C.2.1 Calculating products of fundamental generators — **259**
 - C.2.2 Calculating traces in the adjoint representation — **262**

D Brief literature guide — 265

Bibliography — 266

Index — 269
