Preface — V

Acknowledgments — IX

1	Lie group analysis of differential equations — 1
1.1	Basic concepts and examples from elementary mathematics — 2
1.2	One-parameter group — 5
1.3	Lie equations — 7
1.3.1	Lie theorem — 7
1.3.2	Inverse Lie theorem — 8
1.4	Canonical variables — 11
1.5	Invariants and invariant equations — 13
1.5.1	Invariant equations — 15
1.5.2	Universal invariant — 25
1.6	Transformations in terms of canonical variables — 26
1.7	Exponential map — 28
1.8	The invariance principle for differential equations — 31
1.8.1	The prolongation formulae — 33
1.8.2	Generalization — 34
1.8.3	Illustrative examples: prolonged generators — 36
1.8.4	Invariant solutions (G/H factor system) — 42
1.9	Group transformations admitted by nonlinear partial differential equations — 48
1.9.1	How to find a group admitted by a nonlinear PDE? — 50
1.9.2	Lie algebras and multi-parameter groups — 55
1.9.3	Commutator of the group — 57
1.10	Summary — 59
1.11	Exercises — 62
2	Integration of ordinary differential equations — 64
2.1	First-order equations — 64
2.1.1	Integrating factor — 64
2.1.2	Integration using canonical variables — 70
2.1.3	Integration of ordinary differential equations admitting groups — 72
2.2	Second-order equations — 83
2.2.1	Algorithm — 84
2.2.2	Exact second-order equations — 87
2.3	Exercises — 89

3	Illustration: invariant solutions as internal singularities of nonlinear differential equations — 90
3.1	Invariant solutions — 91
3.1.1	Derivation of invariant solutions — 91
3.1.2	Behavior of invariant solutions — 92
3.2	Perturbation of singular solutions — 93
3.2.1	Application to the first case — 93
3.2.2	Application to the second case — 98
3.2.3	Analysis of numerical or implicit solutions — 100
3.3	Concluding remarks — 102
3.4	Exercises — 102
4	Modeling scenario 1: blood flow of variable density — 104
4.1	Mathematical modeling — 105
4.2	First approach: approximate analysis — 109
4.2.1	Failure of the direct approach — 109
4.2.2	Multi-scale approach — 111
4.2.3	Stability of perturbed steady flows — 113
4.3	Second approach: group theoretical point of view — 116
4.3.1	Traveling waves — 117
4.3.2	Similarity solution — 117
4.4	Concluding remarks — 119
4.5	Exercises — 120
5	Modeling scenario 2: invariant solutions as dispersion relation — 121
5.1	Preliminaries — 122
5.2	Group theoretical derivation of dispersion relations — 125
5.2.1	Homogeneous linear equations — 125
5.2.2	Nonhomogeneous polynomial linear equations — 128
5.3	Concluding remarks — 129
5.4	Exercises — 129
6	Modeling scenario 3: invariant solutions of nonlinear surface waves in the ocean and atmosphere — 130
6.1	Preliminaries — 131
6.2	Cauchy–Poisson free boundary problem — 133
6.3	Linear theory — 134
6.3.1	Two-dimensional case — 136
6.3.2	Three particular cases — 136
6.4	The Lagrange method for the long wave theory — 137
6.4.1	Nondimensionalization — 138
6.5	Shallow water equations — 139

6.6	Nonlinear approximations —	139
6.6.1	The second approximation —	140
6.6.2	Linear analysis —	140
6.6.3	Boussinesq approximation for surface gravity waves —	141
6.6.4	KdV equation —	142
6.6.5	Periodic and solitary solutions —	143
6.7	Modeling equatorial planetary atmospheric waves —	145
6.7.1	Shallow water approximation —	149
6.8	Invariant solution and Fibonacci spiral —	152
6.8.1	Case studies —	154
6.8.2	Asymptotic analysis of invariant solutions —	155
6.8.3	Approximation of the similarity solution for large and small k —	156
6.9	Nonlinear analysis —	156
6.10	Fibonacci spirals —	159
6.11	Hodograph method —	162
6.11.1	Mapping the nonlinear shallow water model to a linear system —	163
6.11.2	Reduction to a second-order linear equation —	165
6.11.3	Characteristics —	165
6.12	Riemann's integration method —	166
6.12.1	Preliminaries —	166
6.12.2	Toward Riemann's function via the invariance principle —	167
6.13	Shock waves —	170
6.14	Perturbed system —	172
6.14.1	Hodograph transform and simplified perturbation —	172
6.14.2	Hodograph transformation of symmetries —	172
6.14.3	Approximate symmetry for the perturbed system —	173
6.14.4	Approximately invariant solution —	174
6.15	Concluding remarks —	176
6.16	Exercises —	178
7	Modeling scenario 4: Rossby nonlinear atmospheric waves along a spherical planet —	180
7.1	Euler and Navier–Stokes equations —	181
7.2	Nonlinear nonviscous flows in rotating reference frame —	184
7.3	Invariant solutions of Euler equations —	187
7.3.1	Invariant solution based on X_2 and X_4 —	188
7.3.2	Invariant solution based on X_4 and X_5 —	189
7.4	Invariant solutions of Navier–Stokes equations —	191
7.5	Discussion of invariant solutions —	194
7.6	Effects of Rossby waves on the energy balance of zonal flows —	196
7.7	Concluding remarks —	198
7.8	Exercises —	199

8 Modeling scenario 5: invariant solutions as ocean whirlpools — 201

- 8.1 Preliminaries — 201
- 8.2 Model equations of internal waves — 204
 - 8.2.1 Linear model and utilization of the Kelvin hypothesis for $u_r \ll 1$ — 206
 - 8.2.2 Effects of rotation on oscillatory modes — 207
- 8.3 Invariant solutions for the case $u_r = 0$ — 218
 - 8.3.1 Well-known invariant internal oscillation solution — 219
 - 8.3.2 Invariant nonstationary solution — 219
 - 8.3.3 Invariant stationary solution — 220
 - 8.3.4 Invariant solutions as nonlinear whirlpools — 221
- 8.4 Approximately invariant solutions for the case $u_r = \varepsilon v_r$ — 223
 - 8.4.1 Well-known approximately invariant internal oscillation solution — 226
 - 8.4.2 Approximately invariant nonstationary solution — 228
 - 8.4.3 Approximately invariant stationary solution — 230
 - 8.4.4 Approximately invariant nonlinear whirlpools — 231
- 8.5 Discussions of invariant and approximately invariant solutions — 232
- 8.6 Weakly nonlinear model — 236
 - 8.6.1 Evanescent modes — 239
 - 8.6.2 Neutral stability — 239
- 8.7 Existence of nonlinear whirlpools — 240
 - 8.7.1 Two examples — 241
 - 8.7.2 Oscillatory solution — 243
- 8.8 Exercises — 246

9 Modeling scenario 6: invariant solutions of internal waves in the ocean — 247

- 9.1 Mathematical modeling — 247
- 9.2 Rotationally invariant solutions and comparison with linear theory — 250
- 9.3 Lagrangian, conservation laws, and exact solutions of the nonlinear internal waves — 257
 - 9.3.1 Adjoint system to the Boussinesq model (9.52)–(9.54) — 259
 - 9.3.2 Self-adjointness of the Boussinesq model (9.52)–(9.54) — 260
 - 9.3.3 Conservation laws — 260
 - 9.3.4 Variational derivatives of expressions with Jacobians — 263
 - 9.3.5 Nonlocal conserved vectors — 264
 - 9.3.6 Computation of nonlocal conserved vectors — 265
 - 9.3.7 Local conserved vectors — 266
- 9.4 Concluding remarks — 274
