|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|----|
| <b>Part I</b>                                                                                                                                          | <b>Perturbation Methods and Applications</b>             |    |
| <hr/>                                                                                                                                                  |                                                          |    |
| Asymptotic Analysis of Stabilizing Fronts<br>By A. van Harten (With 4 Figures) . . . . .                                                               |                                                          | 2  |
| Boundary Layer Analysis for Some Problems of Singular Domain<br>Perturbation<br>By H.J. Weinitschke . . . . .                                          |                                                          | 17 |
| Global Behaviour of Very Thin Cellular Structures. Applications to<br>Networks<br>By D. Cioranescu and J. Saint Jean Paulin (With 2 Figures) . . . . . |                                                          | 26 |
| Nonlinear Diffusion in Stellar Magnetic Loops<br>By F. Verhulst (With 5 Figures) . . . . .                                                             |                                                          | 35 |
| Perturbation Solutions of Magnetomechanical Signal Processing<br>Devices<br>By G.A. Maugin and A.N. Abd-Alla (With 1 Figure) . . . . .                 |                                                          | 44 |
| An Asymptotic Theory for a System of Weakly Nonlinear Wave<br>Equations<br>By W.T. van Horssen (With 2 Figures) . . . . .                              |                                                          | 53 |
| <hr/>                                                                                                                                                  |                                                          |    |
| <b>Part II</b>                                                                                                                                         | <b>Instability, Bifurcations and Transition to Chaos</b> |    |
| <hr/>                                                                                                                                                  |                                                          |    |
| Quasi-Codimension 3 Bifurcation of Invariant $T^2$ Tori for Maps<br>By G. Iooss and J.E. Los (With 4 Figures) . . . . .                                |                                                          | 64 |
| Generalized Lieb-Thirring Inequalities and the Dimension of<br>Attractors Associated to the Ginzburg-Landau p.d.e.<br>By J.-M. Ghidaglia . . . . .     |                                                          | 79 |
| Low Order Spectral Models in Hydrodynamics<br>By A. Doelman and J. Grasman (With 3 Figures) . . . . .                                                  |                                                          | 86 |
| Asymptotical Behaviour of Solutions to Quasi-Linear Schrödinger<br>Equations<br>By H. Lange . . . . .                                                  |                                                          | 98 |

|                                                                                                                                                  |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Lyapounov Stability of Electro-Magneto-Elastic Systems<br>By J.B. Alblas .....                                                                   | 108 |
| Criticality of an Exothermic Reaction-Diffusion System of $n^{th}$ -Order<br>By D. Meinköhn (With 5 Figures) .....                               | 119 |
| Flow Induced Bifurcations to Three-Dimensional Motions of Tubes<br>with an Elastic Support<br>By A. Steindl and H. Troger (With 7 Figures) ..... | 128 |
| Local and Global Bifurcations of a Three Particle System<br>By S.A. van Gils, E. van Groesen, and T.P. Valkering .....                           | 139 |

---

### Part III      **Multibody Dynamics and Control**

---

|                                                                                                                                       |     |
|---------------------------------------------------------------------------------------------------------------------------------------|-----|
| Multibody System Dynamics Mathematical Theory and Industrial<br>Applications<br>By W. Schiehlen (With 3 Figures) .....                | 148 |
| A Finite Element Dynamic Analysis of Robotic Manipulators with<br>Flexible Links<br>By J.B. Jonker and C. Keus (With 4 Figures) ..... | 160 |

---

### Part IV      **Mechanics and Mathematics of Non-Classical Materials**

---

|                                                                                                                                           |     |
|-------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Mathematical Modelling for Non-Classical Materials<br>By V. Tvergaard (With 7 Figures) .....                                              | 174 |
| Nonstandard Modelling of Certain Quasi-Stationary Debonding<br>Processes in Laminates<br>By C. Woźniak (With 2 Figures) .....             | 186 |
| Multilevel Model of Micro-Macro Interactions and Residual Stresses in<br>Physical Systems<br>By B. Orłowska .....                         | 193 |
| Hemivariational Inequalities and Their Applications to Composite<br>Material Structures<br>By P.D. Panagiotopoulos (With 2 Figures) ..... | 204 |
| Poiseuille Flows of Incompressible Simple Fluids<br>By G. Mayne .....                                                                     | 215 |
| Properly Posed Boundary Condition and the Existence Theorem for<br>Supefluid He <sup>4</sup><br>By Z. Peradzyński (With 2 Figures) .....  | 224 |
| Mathematical Aspects of the Theory of Viscoelasticity<br>By J. Brilla .....                                                               | 238 |

**Part V                      New Interactions of Mathematics and Mechanics**

---

|                                                                                                                                                           |            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| On Saint-Venant's Problem and Saint-Venant's Principle in Nonlinear Elasticity<br>By A. Mielke . . . . .                                                  | 252        |
| Hypermembrane Shells<br>By J.L. Buchanan and R.P. Gilbert . . . . .                                                                                       | 261        |
| On the Problem of Constructing the Mathematical Theory of Plates and Shells<br>By T.S. Vashakmadze . . . . .                                              | 273        |
| Application of Extremum Principles to Mixed Boundary-Value Problems in Non-linear Elasticity<br>By J.B. Haddow and R.W. Ogden . . . . .                   | 280        |
| Application of Bivariate B-Splines to a Plate Bending Problem<br>By C.R. Traas (With 1 Figure) . . . . .                                                  | 290        |
| Entropy and Dynamical Stability – a Method Due to Lagrange-Formalism as Applied to Thermodynamics of Irreversible Processes<br>By K.-H. Anthony . . . . . | 297        |
| A Thermodynamic Theory for Turbulence<br>By J. Verhas (With 4 Figures) . . . . .                                                                          | 321        |
| Approach to Lower Dimensional Dynamical Systems: Thermodynamical Aspects<br>By M. Grmela . . . . .                                                        | 329        |
| A Functional Analytic Approach to an Optimization Problem of Hydrodynamic Propulsion<br>By H.P. Urbach (With 4 Figures) . . . . .                         | 342        |
| Nonlinear Problems in the Kinetic Theory of Gases<br>By C. Cercignani . . . . .                                                                           | 351        |
| <b>Index of Contributors . . . . .</b>                                                                                                                    | <b>361</b> |
