

Table of Contents

Continuum Hypothesis in the Computation of Gas-Solid Flows

J.Y. Tu and C.A.J. Fletcher	1
1. Introduction	1
2. Governing Equations	2
2.1 Gas Phase	2
2.2 Particulate Phase	3
2.3 Boundary Conditions	4
3. Numerical Procedure	5
4. Numerical Results	6
5. Conclusions	10

Numerical Modelling of Two- and Three-Dimensional External and Internal Unsteady Incompressible Flow Problems

Günter K.F. Bärwolff	13
1. Introduction	13
2. The Mathematical Model – The Governing Equations	13
3. The Numerical Solution Method	15
4. The Solution of the Equation Systems (3.9) and (3.10) – Solvability Conditions	17
5. The Application of the Solution Methods to Crystal Melt Flow	19
5.1 Wheeler’s Benchmark Problem	19
5.2 The Numerical Simulation of Vertically Situated ($Bi_{0.5}Sb_{1.5}Te_3$) Melt Zones	22
5.3 Further Investigations	25
6. The External Flow Around a Cylinder	25

Numerical Experiments in Double-Diffusive Convection

R. Peyret and J.M. Vanel	33
1. Introduction	33
2. The Motion Equations and Their Numerical Solution	37
3. Lateral Heating of a Stratified Fluid	40
4. Conclusion	49

New Potentialities of Computational Experiment in Tsunami Problem

Yu.I. Shokin, G.S. Khakimyanov, and L.B. Chubarov	53
1. Introduction	53
2. Basic Mathematical Models	53
3. Methodological Principles of Some Applied Problems of Tsunami by Computational Experiment	58
3.1 Apriori Zoning of the Coast	58
3.2 On-Line Assessment of the Hazardous Wave Parameters	58
4. Computational Experiment Facilities Employed for the Training of the Tsunami Warning Service Personnel and of the Population in the Threatened Zones	59

General Balance Equations for a Fluid–Fluid Interface in Magnetofluidynamics

Soubbaramayer	63
1. Introduction	63
2. MFD Model: Integral Conservative Form	63
3. Balance Equations for the Interface	66
4. Application to the Calculation of the Surface Depression in a High- Current Arc Weld Pool	66
5. Conclusion	68

Group-Invariant Solutions of Hydrodynamics

S.V. Coggeshall	71
1. Introduction	71
2. Lie Groups Applied to Differential Equations	72
3. Hydrodynamics Model	75
4. One-Dimensional Solutions	78
4.1 Traditional Similarity Solutions	78
4.2 Exponential Solutions	79
4.3 Projective Group Solutions	80
4.4 Solutions Including Conduction	83
4.5 Solutions with Shocks	84
4.6 Boundary Conditions	86
5. Two-Dimensional Solutions	86
5.1 Multiple Reductions Using Lie Groups	86
5.2 Reductions to ODE's	88
6. 3-D Solutions	92
7. Analytic Solutions	94

**Survey on Exact Solutions for Discrete Models
of the Boltzmann Equation**

Henri Cabannes 103

1. Introduction 103

2. Broadwell Equations 104

 2.1 Self-Similar Solutions 104

 2.2 Cornille’s Solutions 106

3. Models with 14 Velocities 107

4. Models with Triple Collisions 109

5. Two-Dimensional Semi-Continuous Model 111

6. Conclusion 113

**Boundary Conditions for Discrete Models of Gases
and Applications to Couette Flows**

Amah D’Almeida and Renée Gatignol 115

1. Introduction 115

2. Discrete Kinetic Theory 116

3. Boundary Conditions 118

4. Couette Flows 122

5. Results 125

 5.1 Study of the Tangential Velocity 125

 5.2 Study of the Temperature 128

6. Conclusion 129

**Computation of Viscous Transonic Flow
Around the F5 Wing**

Arthur Rizzi 131

1. Introduction 131

2. Governing Equations and Boundary Conditions 132

 2.1 Navier–Stokes Equations 132

 2.2 Turbulence Model 134

 2.3 Boundary Conditions 135

3. Numerical Method 136

 3.1 Spatial Discretization 136

 3.2 Numerical Damping 138

 3.3 Time Integration 139

 3.4 Initialization and Boundary Treatment 139

 3.5 Stability 140

4. Results 143

 4.1 O-O Mesh 143

 4.2 Case 1: $\alpha = 0^\circ$ 145

 4.3 Case 2: $\alpha = 2^\circ$ 146

5. Conclusions 147

A Time-Dependent Space Marching Algorithm for Three-Dimensional PNS Equations

Wang Ru-quan and Xue Ju-kui 151

1. Introduction 151
2. Governing Equations 152
3. The Flux-Difference Splitting 152
4. Explicit-Implicit Difference Scheme 154
 - 4.1 Multi-Sweep Technique 156
 - 4.2 Single-Sweep Technique 156
5. Numerical Tests 157
 - 5.1 The Hypersonic Flow Past the Sphere-Cone at High Angle of Attack 157
 - 5.2 Hypersonic Flow Around the Simplified Space-Shuttle Orbiter 157
6. Conclusions 159

New Potential-Field Properties of General Laminar and Turbulent Motions of Newtonian Fluids

H. Bischoff and E. Kaucher 163

1. Introduction 163
2. Physical and Mathematical Preliminaries 164
 - 2.1 Mathematical Laws 164
 - 2.2 Physical Terminologies and Fundamental Laws 169
3. Derivation of Some Field Properties of NSE 172
 - 3.1 Relation Between Mechanical and Internal Energy 172
 - 3.2 The Dissipation Minimum Principle in the Stationary Case 173
 - 3.3 Potential Field Properties in the Stationary Case 175
4. Thermodynamical Stability Criterion for Instationary Flows 177
5. The Instationary Turbulent Flow in Temporal Mean 182
6. Conclusion 185

Boundary Layer Turbulence and the Control by Suction

Y. Aihara 187

1. Introduction 187
2. Flow Change with the Development of Boundary Layer 188
3. Discussion on Energy 190
4. Self-Organization of Turbulent Boundary Layer 191
5. Experiment on Control of Turbulent Boundary Layer 192
6. Conclusions 195

On the Quasi-Geostrophic Drag on a Rising Sphere in a Rotating Fluid

M. Ungarish 197

1. Introduction 197

2. Solution	198
3. Results	199
 Two-Dimensional Nonlinear Saturation Behaviour of Instability Waves in a Boundary Layer at Mach 5	
N.A. Adams and L. Kleiser	203
1. Introduction	203
2. Governing Equations	204
3. Numerical Method	206
4. Simulation Results	207
5. Perturbation Evolution	207
6. Evolution of the Flow Field	211
7. Shock Identification	213
8. Conclusions	216
 Inertial Convection in Turbulent Rayleigh–Bénard Convection at Small Prandtl Numbers	
G. Grötzbach and M. Wörner	219
1. Introduction	219
2. Simulation Method	221
3. Case Specifications and Initial Data	222
4. Results	225
4.1 Verification	225
4.2 Flow Mechanisms and Dynamics	226
4.3 Heat Transfer Statistics	229
5. Conclusions	229
 The GRP Treatment of Flow Singularities	
M. Ben-Artzi, A. Birman, and J. Falcovitz	233
1. Tracking of Singularities	236
2. Geometrical Singularities	238
3. Narrow Reaction Zones in Combustion Calculations	240
 Application of the Multidomain Local Fourier Method for CFD in Complex Geometries	
L. Vozovoi, M. Israeli, and A. Averbuch	245
1. Introduction	245
2. Multidomain Local Fourier Method (MDLF)	247
3. Problems in Complex Geometries	249
4. Preconditioned Iteration Method with Spectral Preconditioner	250
5. Demonstration for the Navier–Stokes System	251

Confined Swirling Flows – A Continuing Challenge

Pinhas Bar-Yoseph	257
1. Introduction	257
2. Statement of the Problem	257
2.1 Disk–Cylinder System	259
2.2 Spherical Annulus	259
2.3 Cylindrical Annulus	260
2.4 Sphere–Capsule System	260
3. Numerical Formulation	260
4. Results and Discussion	261
4.1 Disk–Cylinder System	261
4.2 Spherical Annulus	262
4.3 Cylindrical Annulus	262
4.4 Sphere–Capsule System	264
5. Conclusions	266
5.1 Present Study	266
5.2 Future Trends	266

Eshelbian Continuum Mechanics and Nonlinear Waves

G.A. Maugin	269
1. Introduction	269
2. Momentum and Pseudo-Momentum; Force and Pseudo-Force	270
3. Field Formulation	273
4. Non–Equivalence Between Global Formulations	275
5. The Role of Pseudomomentum and Energy in Nonlinear–Wave Propagation	277
5.1 General Features	277
5.2 First Example: The “Good” Boussinesq (GoB) Equation	279
5.3 Second Example: The “Generalized” Boussinesq Equation (GB)	279
5.4 Material Global Forces as Perturbations	282
6. A Newtonian Mechanics for Global Material Forces?	284
