1	Atoms	1
	<i>Hans Kleinpoppen</i>	
1.1	Development of atomic physics	1
1.2	The older atomic theory	3
1.2.1	The atomic model of Rutherford and Bohr	3
1.2.2	The energy-level scheme and the spectral series of atomic hydrogen	10
1.3	Schrödinger's form of quantum mechanics	14
1.3.1	The time-dependent Schrödinger equation	14
1.3.2	The stationary Schrödinger equation	16
1.3.3	Zero-potential solution of the Schrödinger equation	17
1.3.4	The solution of the Schrödinger equation for the central Coulomb field in the hydrogen atom	18
1.3.5	The gross structure of the energy states of atomic hydrogen	29
1.3.6	Fine-structure and hyperfine-structure splitting of atomic hydrogen	30
1.3.6.1	Spin-orbit interaction and relativistic corrections as 'normal' fine structure .	31
1.3.6.2	The hyperfine structure and isotopic shift	40
1.3.6.3	Lamb shift as anomalous fine structure (quantum electrodynamical effect) .	50
1.4	Attempts at generalization and the development of an abstract theory of quantum mechanics	52
1.4.1	Operators, eigenvalues, eigenfunctions and quantum-mechanical averages ..	53
1.4.2	The Dirac notation and matrix formulation of quantum mechanics	56
1.4.2.1	The linear vector space (Hilbert space)	56
1.4.2.2	The postulates of quantum mechanics expressed with state operators and state vectors	60
1.4.2.3	Further consequences and results of the quantum mechanical postulates ...	61
1.4.2.4	The quantum-mechanical oscillator	63
1.4.2.5	The quantum-mechanical potential well	68
1.4.2.6	Selection rules and transition matrix elements	73
1.5	The structure of atoms with more than one electron	82
1.5.1	The electrostatic correlation	83
1.5.2	Russel-Saunders and <i>jj</i> coupling	83
1.5.3	The Pauli principle and the symmetry of wave functions	85
1.5.4	The structure of the helium atom	87
1.5.5	Building-up principles and the periodic system of atoms	95
1.5.6	The spectra of the alkali metal atoms	102
1.5.7	The spectra of the alkaline earth metal atoms and the two-electron systems zinc, cadmium and mercury	110
1.5.8	Multiplet spectra of many-electron atoms	112
1.5.8.1	The elements of the p groups	113
1.5.8.2	The elements of the d groups	118

X Contents

1.5.9	Energy structure and the spectra of positive ions	119
1.5.10	Negative ions	120
1.5.11	Energy structure of inner shells. X-ray spectra, Auger effect and Coster-Kronig transitions	121
1.5.12	X-ray bremsstrahlung	137
1.6	Atoms in external fields	142
1.6.1	Zeeman effect – atoms in magnetic fields	142
1.6.1.1	Normal Zeeman effect and Lorentz triplets	143
1.6.1.2	Anomalous Zeeman effect and the Landé g factor	145
1.6.1.3	Quadratic Zeeman effect, diamagnetism and Landau regions	155
1.6.2	Electrical splitting of atomic energy states – Stark effect	164
1.7	Experimental methods and applications of atomic spectroscopy	175
1.7.1	Atomic targets and beams	175
1.7.1.1	Gaseous atomic cells and atomic beams	175
1.7.1.2	Ion beams, ion traps and electron traps	181
1.7.2	The width and shape of atomic spectral lines	184
1.7.2.1	The natural or radiation line width, the Lorentzian line shape	184
1.7.2.2	Collision or pressure broadening of spectral lines	186
1.7.2.3	Doppler broadening	187
1.7.2.4	The Voigt profile	189
1.7.2.5	Saturation effect and self-reversal of spectral lines	190
1.7.3	Radio-frequency and microwave spectroscopy	192
1.7.3.1	Electric and magnetic dipole transitions	192
1.7.3.2	The magnetic atomic beam resonance method of Rabi	196
1.7.3.3	The hydrogen maser and the hyperfine structure of the hydrogen atom	200
1.7.3.4	The g factor of free electrons and positrons	203
1.7.4	Optical and laser methods	204
1.7.4.1	Doppler-free one- and two-photon laser spectroscopy	205
1.7.4.2	Radio-frequency and microwave spectroscopy and Lamb-shift experiments	209
1.7.4.3	Optical resonance technique	212
1.7.4.4	Hanle-effect, level-crossing and anticrossing spectroscopy	220
1.7.4.5	Spectroscopy with fast atomic particles and excitation by foils (fast-beam and beam-foil spectroscopy)	230
1.7.4.6	Spectroscopy with synchrotron radiation	232
1.7.4.7	Metastable states of atoms	237
1.7.4.8	Trapped ions and atoms	249
1.8	Exotic atoms	253
1.9	Rydberg atoms	257
1.10	Atomic collision processes	259
1.10.1	Classification of atomic collision processes	259
1.10.2	Total and differential cross sections	261
1.10.3	Photoionization of atoms	263
1.10.3.1	Experimental methods for measuring photoionization cross sections	264
1.10.3.2	Results for the total cross sections	272
1.10.3.3	Spin-orbit interaction and the Fano effect	275
1.10.3.4	Photoionization with polarized atoms	278
1.10.4	Collision processes between electrons (positrons) and atoms	280
1.10.4.1	Partial-wave analysis and Ramsauer-Townsend effect	281

1.10.4.2	Resonance structures	287
1.10.4.3	Coincidence experiments	297
1.10.4.4	Spin effects	312
1.10.5	Ion-atom and atom-atom collision processes	323
1.10.5.1	Impact-parameter representation in the classical approximation	323
1.10.5.2	Quasi-molecular bonds	324
1.10.5.3	Potential scattering and quantum-mechanical structure effects	330
1.10.5.4	Coincidence and spin experiments	334
1.10.5.5	Antiproton-atom collisions	340

Introduction remarks to chapter 2 and 3: Molecules	353
--	-----

2 Molecules – bonds and reactions	355
<i>Nikolaus Risch</i>	

2.1	Chemical bonds	355
2.1.1	Chemical formulas	355
2.1.2	The periodicity of chemical properties	356
2.1.3	Metals	358
2.1.4	The ionic bond	360
2.1.5	The covalent bond	361
2.2	Dynamics of reaction	366
2.2.1	Chemical equilibrium	366
2.2.2	Kinetics, catalysis	367
2.2.3	Acid-base reactions	370
2.2.4	Redox reactions	371
2.3	Synthesis	372
2.3.1	Reaction possibilities and mechanisms	372
2.3.2	Stereochemistry	376
2.3.3	Structure elucidation	381
2.3.4	Some interesting structures	382

3 Molecules – spectroscopy and structure	385
<i>Manfred Fink</i>	

3.1	Introduction	385
3.2	Spectroscopy with molecules in the electronic ground state	395
3.2.1	Nuclear magnetic resonance (NMR)	395
3.2.1.1	Introduction	395
3.2.1.2	Absorption and emission	397
3.2.1.3	Bloch's equations	400
3.2.1.4	The NMR measurement method	403
3.2.1.5	Molecular structures and NMR	410
3.2.1.6	NMR spectroscopy in medicine	429
3.2.2	Electron spin-resonance spectroscopy	432
3.2.2.1	Definitions and measurement methods	432
3.2.2.2	Hyperfine-structure couplings	432

XII Contents

3.2.2.3	ESR in transition metal compounds	434
3.2.2.4	ENDOR	436
3.2.3	Microwave spectroscopy	437
3.2.3.1	Introduction and definitions	437
3.2.3.2	Linear molecules	438
3.2.3.3	Bent molecules	441
3.2.3.4	The microwave apparatus	446
3.2.3.5	Applications of microwave spectroscopy	449
3.2.4	Infrared spectroscopy	453
3.2.4.1	Introduction	453
3.2.4.2	Symmetries in polyatomic molecules	457
3.2.4.3	The infrared spectrometer	460
3.2.4.4	Analysis of infrared spectra	463
3.2.4.5	The CO ₂ laser	467
3.2.4.6	Infrared laser spectroscopy	469
3.2.5	Raman spectroscopy	470
3.2.5.1	Introduction and theory	470
3.2.5.2	Raman spectrometer	477
3.2.5.3	Raman spectra	479
3.2.5.4	Resonance Raman spectroscopy	489
3.2.5.5	Coherent anti-Stokes Raman spectroscopy (CARS)	494
3.2.6	Multiphoton IR excitations	499
3.2.6.1	Introduction	499
3.2.6.2	Measurements in the quasi-continuum	500
3.2.6.3	Model calculations of multiphoton excitations	502
3.3	Molecular structures in the electronic ground state	504
3.3.1	High-energy electron diffraction	505
3.3.2	Low-energy electron scattering	517
3.3.2.1	Introduction	517
3.3.2.2	Elastic electron scattering from oriented molecules	518
3.3.2.3	Elastic electron scattering from non-oriented molecules	526
3.3.2.4	Inelastic electron scattering inside the electronic ground state	535
3.3.2.5	Theory of electron-molecule scattering	540
3.3.3	X-ray scattering of molecules in the gas phase	545
3.3.3.1	Introduction	545
3.3.3.2	Measuring technique and results	546
3.3.4	Holography of molecules	549
3.4	Molecules in excited electronic states	550
3.4.1	The Born-Oppenheimer theorem	550
3.4.2	Classification and term symbols of electronically excited molecular states ..	554
3.4.3	Orbitals for diatomic molecules	561
3.4.3.1	The homonuclear case	561
3.4.3.2	Molecular orbitals of diatomic heteromolecules	566
3.4.4	Selection rules and line intensities	568
3.4.4.1	The electronic contribution	568
3.4.4.2	Vibrational structure of electronic excitations	570
3.4.4.3	Rotational structure of an electronic band system	576
3.4.5	Inelastic electron scattering	580
3.4.5.1	Comparison between optical excitation and electron impact processes	580
3.4.5.2	Oscillator strengths; Bethe surfaces and sum rules	582

3.4.5.3	Experimental inelastic cross sections	584
3.4.5.4	EXAFS (extended X-ray absorption fine structure)	587
3.5	Examples of molecules of interest to physics	590
3.5.1	Muonic molecules (dtp) de_2	590
3.5.1.1	Muonic hydrogen	590
3.5.1.2	Muon-catalyzed fusion	592
3.5.2	The multiple bonds of transition metals	596
3.5.2.1	Introduction	596
3.5.2.2	The ultrashort Cr —Cr bond length	600
3.5.2.3	The photoelectron spectra of compounds with multiple bonds	601
3.5.3	Van der Waals molecules	607
3.5.3.1	Occurrence and detection	607
3.5.3.2	Properties of van der Waals molecules	610
3.5.3.3	Structures and molecular orbitals	615
3.5.3.4	The role of vdW molecules in the atmosphere	618
4	Nuclei	625
	<i>Klaus-Peter Lieb</i>	
4.1	Introduction	625
4.1.1	What does nuclear physics deal with?	625
4.1.2	A short outline of the historical development	628
4.2	General properties of atomic nuclei	631
4.2.1	Definitions	631
4.2.2	The atomic number Z	632
4.2.3	Nuclear masses and binding energies	636
4.2.3.1	Definitions	636
4.2.3.2	Mass separators and spectrometers	638
4.2.3.3	Separation energies, Q values; the mass of the neutron	641
4.2.3.4	Systematics of binding energies	644
4.2.4	Nuclear radii and nucleon distributions	645
4.2.4.1	Nucleon distributions	645
4.2.4.2	Nuclear charge-density distribution	648
4.2.4.3	Electric quadrupole moments	660
4.2.5	Nuclear spins and magnetic moments	662
4.3	Nuclear models	663
4.3.1	The droplet model	664
4.3.2	The collective model	666
4.3.2.1	Nuclear vibrations	666
4.3.2.2	Rotational band in even-even nuclei	671
4.3.3	The single-particle shell model	674
4.3.3.1	Magic numbers	674
4.3.3.2	The shell model	677
4.3.3.3	Consequences of the shell model. Residual interactions	680
4.3.4	The Fermi-gas model	685
4.3.5	Couplings of collective and single-particle degrees of freedom	689
4.4	The nucleon-nucleon interaction	694
4.4.1	The deuteron	695

XIV Contents

4.4.2	Nucleon-nucleon scattering	698
4.4.2.1	Proton-neutron scattering	698
4.4.2.2	Proton-proton scattering	703
4.4.3	Isospin	707
4.4.4	Phenomenological nucleon-nucleon potentials	710
4.4.5	Mesons and/or quarks in nuclei?	713
4.5	Nuclear decays	720
4.5.1	Chart of nuclides, decay law, conservation laws	720
4.5.2	Alpha decay	724
4.5.2.1	Some important observations	724
4.5.2.2	The Gamow factor	726
4.5.2.3	Recent results	728
4.5.3	Nuclear fission	731
4.5.3.1	The fission process	731
4.5.3.2	Energy balance, fission barrier	732
4.5.3.3	Fission reactors	735
4.5.4	Electromagnetic radiation of the nucleus	738
4.5.4.1	Selection rules	738
4.5.4.2	Single-particle widths	740
4.5.4.3	Measurement of nuclear lifetimes	742
4.5.4.4	Nuclear resonance absorption and the Mössbauer effect	746
4.5.4.5	Electron conversion (EC)	749
4.5.5	Beta decays	750
4.5.5.1	Neutrinos	750
4.5.5.2	The shape of the β spectrum	752
4.5.5.3	β -decay probability	755
4.5.5.4	Parity violation	757
4.5.5.5	Helicity of the neutrino	759
4.5.6	Radiodating	761

5 Particles 773

Peter Schmüser, Hartwig Spitzer

5.1	Historical development and basic concepts of particle physics	773
5.1.1	Elementary particles in atomic and nuclear physics	773
5.1.2	First attempts towards an understanding of the fundamental interactions	774
5.1.3	Our present picture of elementary particles and their interactions	777
5.2	Accelerators and particle detectors	782
5.2.1	Basic elements of accelerator physics	782
5.2.1.1	Beam optics and betatron oscillations	782
5.2.1.2	Acceleration	786
5.2.1.3	Influence of synchrotron radiation	788
5.2.1.4	Particle sources and pre-accelerators	790
5.2.2	Storage rings and linear colliders	791
5.2.3	Interaction of particles and γ rays with matter	793
5.2.3.1	Ionization	793
5.2.3.2	Bremsstrahlung	795
5.2.3.3	Cherenkov and transition radiation	796
5.2.3.4	Pair production and electromagnetic showers	797

5.2.3.5	Hadronic showers	797
5.2.4	Particle detectors	798
5.2.4.1	Basic tasks of the detector components	798
5.2.4.2	Scintillation counters	798
5.2.4.3	Bubble chambers	798
5.2.4.4	Proportional and drift chambers	799
5.2.4.5	Time-of-flight and Cherenkov counters	800
5.2.4.6	Shower counters and calorimeters	801
5.2.4.7	A large storage-ring experiment	803
5.3	Elementary particles and their properties	804
5.3.1	Particles with strong decays	805
5.3.2	Antiparticles	809
5.3.3	Mass and mean life	812
5.3.4	Spin and magnetic moment	815
5.3.5	Charge-like quantum numbers	818
5.3.6	Parity	819
5.3.7	Charge conjugation, CP and time reversal	822
5.4	Quark model	823
5.4.1	Ordering of hadrons into isospin and SU(3) multiplets	823
5.4.2	The "New Particles"	826
5.4.3	Experimental evidence for the existence of quarks	830
5.4.3.1	Inelastic electron-nucleon scattering	830
5.4.3.2	Hadron jets in electron-positron annihilation	832
5.4.3.3	Charmonium and bottomium	834
5.4.4	Color charges and gluons	836
5.4.5	Discovery of the gluons	838
5.5	Feynman diagrams and particle reactions	840
5.5.1	Electromagnetic reactions	840
5.5.1.1	Elementary processes and Feynman diagrams in QED	840
5.5.1.2	Examples of electromagnetic reactions	842
5.5.2	Weak interactions	846
5.5.3	Strong interactions	851
5.6	Unification of interactions	855
5.6.1	Experimental foundations of the unified electro-weak interaction	855
5.6.2	Gauge theory of electromagnetic interactions	857
5.6.3	The Standard Model of electro-weak interactions	860
5.6.4	Quantum chromodynamics as a gauge theory	866
5.7	Conclusions and further outlook	868
Appendix: Relativistic kinematics and units		869
The 1986 recommended values of the fundamental physical constants		875
