List of contributors	XI
Introduction	XIII
1. Nonequilibrium thermodynamics applied to energy conversion in biological systems	
• Introduction	
• Elements of nonequilibrium thermodynamics	
• Steady states	
• Mechanisms of coupling between processes	
• Phenomenological description of processes and systems	
• Control and regulation of processes	
<i>D. Walz</i>	1
2. Global bioenergetics	
• Introduction	
• Thermodynamic principles	
• Thermodynamic efficiencies and global bioenergetics	
• The current steady state: Global cycles of matter associated with global bioenergetics	
• Approach to the current steady state: Evolution of free-enthalpy transducing biosystems	
<i>H. V. Westerhoff, W. Crielaard and K. J. Hellingwerf</i>	57
3. Vectorial bioenergetics	
• Bioenergetics in a homogeneous compartment	
• Cellular compartmentation and bioenergetics	
• Proton bioenergetics	
• Transport phenomena	
• Sodium bioenergetics	
<i>B. A. Melandri</i>	95

4. Energetics of aerobic and anaerobic bacteria	
• Introduction	
• Principles of biological energy transformations	
• Energy-generating processes	
• Energy-requiring processes	
<i>M. Blaut and G. Gottschalk</i>	139
5. Chloroplasts	
• Introduction	
• Light-driven electron transport and proton translocation	
• Carbon metabolism	
• Other metabolic pathways	
• Transport across the envelope	
• Photoregulation of chloroplast function	
<i>E. Haag and G. Renger</i>	212
6. The mammalian mitochondrial respiratory chain	
• Introduction	
• Principles of electron transfer-linked proton translocation	
• NADH: ubiquinone oxidoreductase (complex I)	
• Succinate: ubiquinone oxidoreductase (complex II)	
• Ubihydroquinone: cytochrome c oxidoreductase (complex III)	
• The diffusible redox carriers ubiquinone and cytochrome c	
• Energy balance of electron transfer reactions	
• Carrier proteins involved in energy transduction	
• Interaction of electron transfer chain, ATP synthase, adenine nucleotide carrier, and phosphate carrier, resulting in the coupling of oxidative phosphorylation	
<i>G. von Jagow, B. M. Geier and T. A. Link</i>	274
7. Photosystem II and water oxidation in cyanobacteria, algae and higher plants	
• Introduction	
• Overall organisation of water cleavage in Photosystem II	
• Light absorption and transformation into electrochemical free energy in Photosystem II	
• Water oxidation	
• Plastoquinone reduction	
<i>G. Renger</i>	310
8. The photosystem I reaction center in oxygenic photosynthesis	
• Introduction	
• Energy transfer in PS-I	
• Electron transfer in PS-I	

• Polypeptides of the PS-I reaction center	
• Structure of the PS-I reaction center	
• Comparison with green sulfur bacteria and heliobacteria	
<i>P. Mathis</i>	359
9. The cytochrome <i>b6f/bcl</i> -complexes	
• Introduction	
• Occurrence	
• Components and structure	
• Function	
• Regulation	
<i>G. Hauska and M. Büttner</i>	389
10. Cytochrome <i>c</i> oxidase	
• Introduction	
• Structure	
• Spectroscopy	
• Ligand binding reactions	
• Electron transfer reactions	
• Proton transfer reactions	
• Electrochemistry of the metal centres	
<i>P. R. Rich and A. J. Moody</i>	418
11. Bacteriorhodopsin	
• Introduction	
• The bacterium	
• Bioenergetics of <i>H. salinarium</i>	
• The bacteriorhodopsin in purple membrane	
• The photocycle	
• Halorhodopsin	
<i>L. Keszthelyi</i>	457
12. Structure, function and regulation of the H^+ -ATPases from chloroplasts	
• Introduction	
• Structure of H^+ -ATPases	
• The catalytic reaction of H^+ -ATPases	
• The regulation of CF_0F_1	
<i>P. Gräber</i>	486
