| <b>Introduction</b> . . . . . | xi |

## PART I. MODELIZATION

|                                                                                              |                 |
|----------------------------------------------------------------------------------------------|-----------------|
| <b>1. Edge detection and segmentation</b> . . . . .                                          | 3               |
| 1. Is there a general theory for segmentation? . . . . .                                     | 3               |
| 2. Principles of multiscale analysis . . . . .                                               | 7               |
| <b>2. Linear and nonlinear multiscale filtering</b> . . . . .                                | 8               |
| 1. The linear model (Hildreth, Marr, Witkin, Koenderink,...) . . . . .                       | 8               |
| 2. The Perona and Malik theory . . . . .                                                     | 11              |
| 3. Anisotropic diffusion and "mean curvature motion" . . . . .                               | 15              |
| 4. Image restoration by mean curvature motion . . . . .                                      | 16              |
| <b>3. Region and edge growing methods</b> . . . . .                                          | 21 <sup>A</sup> |
| 1. Formalization of region growing methods.<br>(Brince and Fennema, Pavlidis, ...) . . . . . | 21              |
| 2. Edge growing methods . . . . .                                                            | 25              |
| 3. Hybrid methods . . . . .                                                                  | 28              |
| 4. How to translate a heuristic algorithm<br>into a variational theory . . . . .             | 29              |
| <b>4. Variational theories of segmentation</b> . . . . .                                     | 35              |
| 1. The Nitzberg and Mumford 2.1-D sketch . . . . .                                           | 35              |
| 2. The "structural saliency" of Sha'ashua and Ullman . . . . .                               | 37              |
| 3. The "minimum description length" method of Yvon Leclerc . . . . .                         | 39              |
| 4. Algorithms for minimizing the general Mumford<br>and Shah energy . . . . .                | 40              |
| 5. Affine invariant segmentation . . . . .                                                   | 42              |
| <b>5. The piecewise constant Mumford-Shah model:<br/>    mathematical analysis</b> . . . . . | 46              |
| 1. Main theorem . . . . .                                                                    | 47              |
| 2. Definition and elementary properties of segmentations . . . . .                           | 47              |
| 3. Properties of segmentations obtained by merging.<br>Proof of the main theorem . . . . .   | 52              |

|                                                                 |    |
|-----------------------------------------------------------------|----|
| 4. A pyramidal algorithm computing 2-normal segmentations . . . | 58 |
| 5. Examples . . . . .                                           | 60 |

## PART II. ELEMENTS OF GEOMETRIC MEASURE THEORY

|                                                                                                         |            |
|---------------------------------------------------------------------------------------------------------|------------|
| <b>6. Hausdorff measure . . . . .</b>                                                                   | <b>63</b>  |
| 1. Hausdorff outer measure . . . . .                                                                    | 63         |
| 2. Outer measures in topological spaces . . . . .                                                       | 70         |
| 3. Connected sets of finite 1-dimensional Hausdorff measure . . . .                                     | 75         |
| 4. A suggesting example of Hausdorff measurable set<br>with finite length . . . . .                     | 76         |
| <b>7. Covering lemmas in a metric space . . . . .</b>                                                   | <b>79</b>  |
| 1. Elementary properties of generic coverings . . . . .                                                 | 79         |
| 2. Vitali coverings . . . . .                                                                           | 82         |
| 3. Hausdorff and Lebesgue measure . . . . .                                                             | 84         |
| <b>8. Density properties . . . . .</b>                                                                  | <b>86</b>  |
| 1. Upper and lower density . . . . .                                                                    | 87         |
| 2. Regular sets . . . . .                                                                               | 90         |
| <b>9. Tangency properties of regular subsets of <math>\mathbb{R}^N</math> . . . .</b>                   | <b>94</b>  |
| 1. Reflection lemmas . . . . .                                                                          | 94         |
| 2. Approximate tangent space . . . . .                                                                  | 99         |
| 3. Existence of a tangent space . . . . .                                                               | 108        |
| <b>10. Semicontinuity properties of Hausdorff measure . . . .</b>                                       | <b>118</b> |
| 1. Hausdorff distance . . . . .                                                                         | 118        |
| 2. Counterexamples to the semicontinuity of the Hausdorff<br>measure for the Hausdorff metric . . . . . | 120        |
| 3. Upper semicontinuity in $[0,1]$ . . . . .                                                            | 121        |
| 4. Lower semicontinuity of the Hausdorff measure<br>on uniformly concentrated sets . . . . .            | 122        |
| 5. Sequences of compact connected 1-sets . . . . .                                                      | 125        |
| <b>11. Rectifiable sets . . . . .</b>                                                                   | <b>127</b> |
| 1. Rectifiable surfaces and rectifiable sets . . . . .                                                  | 127        |
| 2. Regularity of rectifiable sets . . . . .                                                             | 128        |
| 3. Rectifiable curves . . . . .                                                                         | 133        |
| <b>12. Properties of regular and rectifiable sets . . . . .</b>                                         | <b>136</b> |
| 1. Geometric lemmas . . . . .                                                                           | 136        |
| 2. Equivalence of the notions of regularity and rectifiability . . .                                    | 138        |

3. Projection properties of irregular sets . . . . . 142

**PART III. EXISTENCE AND STRUCTURAL PROPERTIES  
OF THE MINIMAL SEGMENTATIONS  
FOR THE MUMFORD-SHAH MODEL**

**13. Properties of the approximating image  
in the Mumford-Shah model . . . . . 151**

1. Notation and preliminary lemmas . . . . . 151

2. Green Formulas . . . . . 155

3. Interior regularity estimates . . . . . 161

**14. Small oscillation coverings  
and the excision method . . . . . 165**

1. The excision method . . . . . 165

2. Small oscillation coverings . . . . . 167

3. The excision lemmas . . . . . 169

4. The Interpolation Lemma . . . . . 170

5. Energy jump estimates . . . . . 174

6. Proof of the excision lemmas . . . . . 176

**15. Density properties and existence theory  
for the Mumford-Shah minimizers . . . . . 182**

1. The Essentiality Property . . . . . 183

2. The Uniform Density Property . . . . . 184

3. The Concentration Property . . . . . 188

4. The Projection Properties . . . . . 189

5. Existence theory for the Mumford-Shah minimizers . . . . . 192

6. Nonuniqueness of the Mumford-Shah minimizers . . . . . 197

**16. Further properties of the minimizers:  
covering the edge set with a single curve . . . . . 199**

1. The David-Semmes Concentrated Rectifiability Property . . . . . 199

2. Dual curve lemmas . . . . . 202

3. Existence of a rectifiable curve containing the edge set . . . . . 205

4. Existence of a regular curve containing the edge set . . . . . 206

**Bibliographical notes . . . . . 209**
