

Contents

1 Introductory Survey. By F.E. Fujita (With 2 Figures)	1
1.1 New Materials and Necessity of Physics in their Development	1
1.2 Examples of Physics of New Materials	2
1.3 Brief Introduction of the Contents	5
References	9
2 Electronic Structure and Properties of Transition Metal Systems.	
By J. Kanamori (With 8 Figures)	10
2.1 Background	10
2.2 Basic Concepts of Electronic Structure Calculation of Transition Metal Systems	11
2.2.1 Method of Calculation	11
2.2.2 s-d Mixing	13
2.3 Bulk and Defect Electronic Structure of Ferromagnetic Transition Metal Systems	15
2.3.1 Calculation for Periodic Systems	15
2.3.2 Impurities	16
2.3.3 Disordered Alloys	19
2.3.4 Failure of the <i>ab initio</i> Calculation	21
2.3.5 Enhancement of Ferromagnetism in Iron by Nonmagnetic Atoms	23
2.4 Structural Problems	24
2.4.1 Methods of Calculating Phase Diagram of Alloy Systems	24
2.4.2 Ordering on fcc Lattice	25
2.4.3 Examples of <i>ab initio</i> Calculations	27
2.4.4 Lattice Distortion	28
2.5 Limitation of the One Electron Theory	29
2.6 Future Development	31
References	32
3 Structure Characterization of Solid-State Amorphized Materials by X-Ray and Neutron Diffraction. By K. Suzuki	
(With 32 Figures)	35
3.1 New Generation Scattering Experiments	35

3.2	Mechanical Alloying and Mechanical Disordering	36
3.2.1	Mechanical Amorphization of Ni-V Miscible System	36
3.2.2	Mechanical Amorphization of Cu-Ta and Cu-V Immissible Systems	44
3.3	Medium-Range Structure of Metallic Amorphous Alloys	47
3.3.1	Pre-peak in the Structure Factor of Binary Amorphous Alloys	47
3.3.2	Chemical Frustration in Ternary Amorphous Alloys	49
3.4	Conversion of Organic Polymers to Amorphous Ceramics	53
3.5	Hydrogen-Induced Amorphization	56
	References	64
4	Nanophase Materials: Synthesis, Structure, and Properties.	
	By R.W. Siegel (With 30 Figures)	66
4.1	Background	66
4.2	Synthesis and Processing	68
4.3	Structure and Stability	78
4.3.1	Grains and Pores	79
4.3.2	Grain Boundaries	81
4.3.3	Grain Size Stability	90
4.4	Properties	92
4.4.1	Chemical Properties	93
4.4.2	Mechanical Properties	96
4.4.3	Physical Properties	100
4.5	Future Directions	102
	References	103
5	Intercalation Compounds of Transition-Metal Dichalcogenides.	
	By K. Motizuki and N. Suzuki (With 20 Figures)	107
5.1	Background	107
5.2	Electronic Band Structures of 3d Transition-Metal Intercalated Compounds of 1T-Type TiS_2	109
5.2.1	Nonmagnetic States	113
5.2.2	Ferromagnetic States	120
5.2.3	Comparison with Experimental Results	121
5.3	Bonding Nature in M_xTiS_2 (M: 3d Transition-Metal)	123
5.4	Electronic Band Structures of Ag_xTiS_2	128
5.5	2H-Type TX_2 (T = Nb, Ta; X = S, Se) Intercalated with Transition-Metals	130
5.6	Discussion	136
	References	138
6	Structural Phase Transformation. By F.E. Fujita (With 40 Figures)	141
6.1	General View	141

6.1.1	Discoveries of Phase Transformations	141
6.1.2	Continuous and Discontinuous Transformation	144
6.1.3	Various Types of Phase Transitions	146
6.2	A Phenomenological Theory and a Statistical View of Phase Transition	147
6.2.1	Degree of Order and Landau's Formulation of Phase Transition	147
6.2.2	Ehrenfest's Criterion and Landau's Picture in the G-T- η Diagram	149
6.2.3	Fine Heterogeneous Structure in the First Order Transition	150
6.2.4	Statistical Calculation of Embryonic Structure	151
6.3	Martensitic Transformation of Metals and Alloys	153
6.3.1	Martensitic Transformation of Steel	153
6.3.2	Lattice Deformation in Martensitic Transformation	156
6.3.3	Martensitic Transformation of β -Phase Alloys	160
6.4	Shape Memory Effect and Premartensitic Phenomena	162
6.4.1	Mechanism of Shape Memory	162
6.4.2	Superplasticity and Ferroelasticity	165
6.4.3	Lattice Softening and Soft Phonon Mode	167
6.4.4	Premartensitic Structure and its Statistical Thermodynamic Theory	170
6.5	Martensite and Other Problems in Ceramics	174
6.5.1	Martensitic Transformation of Zirconia	174
6.5.2	P-T Phase Diagram and Artificial Diamond	175
6.5.3	CVD Diamond	178
6.6	Conclusions	179
	References	180
7	The Place of Atomic Order in the Physics of Solids and in Metallurgy. By R.W. Cahn (With 21 Figures)	182
7.1	Historical Development	182
7.1.1	Superlattices	185
7.1.2	Imperfect Long-Range Order	187
7.1.3	Critical Phenomena	190
7.2	Antiphase Domains	191
7.2.1	Varieties of Domains	194
7.3	Theory of Ordering	196
7.3.1	The Ordering Energy	196
7.3.2	The Cluster Variation Model	197
7.3.3	"Criticality-Physics"	198
7.3.4	Prediction of Phase Diagrams	199
7.3.5	Prediction of Crystal Structures	200
7.3.6	First-Principles Calculations	201
7.4	Special Experimental Methods	204

7.5	Ordering Kinetics and Disorder Trapping	207
7.5.1	Disorder Trapping	207
7.5.2	Phases with Low Critical Temperatures	209
7.5.3	Rapidly Ordering Phases	210
7.6	Computer Simulation of Ordering and Disordering and Related Features	211
7.7	Ordering and Disordering at Free Surfaces, Interfaces and at Antiphase Domain Boundaries	212
7.7.1	Free Surfaces	212
7.7.2	Interfaces	214
7.8	Magnetic and Atomic Order	215
7.8.1	Directional Order	216
7.9	Ordering in Semiconductors and Other Non-Metals	218
7.9.1	Minerals	218
7.9.2	Semiconductors	218
7.9.3	Superconductors	220
7.9.4	Constitutional Vacancies	221
7.9.5	Plastic Crystals	221
7.10	Order and Mechanical Properties	221
7.11	Conclusion	224
7.12	Addendum	224
