Observations and Physical Processes in Binary Stars

By Steven N. Shore (With 44 Figures)

1. Introduction	1
2. A Brief Historical Prolegomena to the Study of Binaries	2
3. Techniques	4
3.1 Periods and How to Find Them	4
3.2 Light Travel Effects	6
3.3 Radial Velocities	7
3.4 The Mass Function for Spectroscopic Binaries	10
3.5 Resolvable Systems	12
3.6 Photometry and Light Curves	14
3.6.1 Geometric Distortions	14
3.6.2 Limb Darkening	15
3.6.3 Gravity Darkening	16
3.6.4 Reflection Effect	18
3.7 Polarimetry	20
3.8 Doppler Imaging	22
3.9 How to Discover Very Hot or Very Cold Companions of Low Luminosity: Multiwavelength Analyses	28
4. Phenomena and Processes	29
4.1 Timescales: A Summary of Binary Star Observational Problems	29
4.2 Classical Orbits	31
4.3 Perturbations, Roche Geometry, and Full System of Equations for the Evolution of the Orbital Elements	32
4.3.1 The Roche Potential	33
4.3.2 Equations for Orbital Elements	34
4.4 The Lagrangian Points and What They Mean	36
4.5 Resonances	38
4.6 Apsidal Motion	39
4.7 Period Changes	41
4.7.1 Mass Transfer and Mass Loss	41
4.7.2 Gravitational Radiation	43
4.7.3 Disks	43
4.7.4 Winds and Spin	43
4.8 Rotational Synchronization and Orbital Circularization	45

4.9	Light Curve Instabilities: Messy Eaters and Massive Accretion Disks Among the β Lyrae Type Systems	50
4.9.1	W Serpentis	51
4.9.2	β Lyrae	53
4.9.3	The Disks	56
4.10	Pre-main Sequence Binaries	56
4.11	Contact Binaries and Common Envelope Systems	58
4.12	Binary Central Stars of Planetary Nebulae	60
4.13	ζ Aurigae and Related Systems: Tomography of Stellar Atmospheres by Atmospheric Eclipses	61
4.14	Winds in Binaries	66
4.15	Colliding Winds in Binaries	69
4.16	Accretion Wakes and Bow Shocks in Wind Accretors	75
4.17	Symbiotic Stars: The Universal Laboratories	76
4.18	Recurrent Novae and Symbiotics	87
4.19	RS Ophiuchi 1985: The Anatomy of an Outburst Within a Red Giant Wind	89
4.20	Enhanced Magnetic Activity in Close Binaries: RS CVn and Related Stars	92
4.21	Accretion Disks	100
4.22	Boundary Layers in Accretion Flows	104
4.22.1	Boundary Layers: Theory	104
4.22.2	Boundary Layers: Observations	106
4.23	Abundance Anomalies: The Fingerprints of Mass Transfer	110
4.23.1	Barium, CH, CN, and Technetium-poor S Stars	110
4.23.2	Am Stars	112
4.23.3	Algols	114
4.23.4	Blue Stragglers in Clusters	115
4.23.5	Analysis of the Efficiency of Mass Transfer	117
4.24	Magnetic Coupling Between Stars	118
4.25	Twisted Disks, Stream Wagging, and Other Perversities	119
4.25.1	Twisted Disks	119
4.25.2	Transient Disks and Stream Wagging	121
5.	Exeunt	121

Topics in the Theory of Cataclysmic Variables and X-Ray Binaries

By Mario Livio (With 65 Figures)

1. Introduction	135
2. Roche Equipotentials	136
3. Mass Transfer	139
4. The Formation of an Accretion Disk	144
5. Standard Steady Accretion Disk Models	147
6. Angular Momentum Transport Mechanisms	152
6.1 Hydromagnetic Winds	156
6.2 Coherent Spiral Shock Waves	157
6.2.1 On the Theoretical Side	158
6.2.2 On the Observational Side	160
6.3 Instabilities and Magnetic Dynamos	161
7. Accretion from a Stellar Wind – The “Flip-Flop” Instability	166
7.1 The Mass Accretion Rate	166
7.2 Accretion of Angular Momentum	168
7.3 The Stability of Wind Accretion	171
7.4 Possible Observational Implications	177
7.4.1 Variability in the X-ray Luminosity	177
7.4.2 The Spin History	178
7.5 Summary of the Present Status and Remaining Problems	178
8. Dwarf Nova Eruptions	180
8.1 A Brief Summary of a Few Observational Properties	180
8.2 Accretion Disk Timescales	182
8.3 Models for the Eruptions	183
8.3.1 The Mass Transfer Instability Model	183
8.3.2 The Disk Instability Model	185
8.4 Comparison of a Few Theoretical Predictions with Observations	188
8.4.1 The Disk Radius	188
8.4.2 UV, X-ray and Optical Observations Between Outbursts	189
8.4.3 The UV Delay	190
8.4.4 The Bright Spot Luminosity	191
8.5 Assessment of the Viability of the Two Standard Models	192
9. The Formation of Binaries Involving a Compact Component – Some Aspects of Common Envelope Evolution	194
9.1 The Coalescence of White Dwarfs and Type I Supernovae	201
10. Elements in the Theory of Classical Nova Outbursts	205
10.1 A Brief Summary of a Few Observational Properties	205
10.2 The Thermonuclear Runaway Model	210
10.2.1 The Nuclear Reactions Network	211
10.2.2 The Evolution of the Light Curve	212
10.3 Heavy Element Enrichments and Mixing	214
10.4 Mixing Mechanisms	215
10.4.1 Diffusion Induced Convection	215

10.4.2	Shear Mixing	218
10.4.3	Convective Overshoot Induced Flame Propagation	219
10.4.4	Convection Induced Shear Mixing	220
10.5	The Common Envelope Phase in Novae	221
10.5.1	Enhanced Mass Loss	222
10.5.2	Shaping of the Nova Shell	223
10.5.3	Effects on the Binary Separation	223
10.6	The Effects of Various Physical Parameters on the Nature of the Outburst and the Use of Classical Novae as Distance Indicators	227
10.6.1	The Absolute Magnitude at Maximum Light	227
10.6.2	The Timescale to Decline from Maximum by Three Magnitudes, t_3	228
10.6.3	The $M_B - t_3$ Relation	231
10.6.4	The Effects of Other Parameters, Limitations of the $M_B - t_3$ Relation	231
10.6.5	The t_3 Distribution	235
10.6.6	Other Possible Calibrations for the Distance Scale Using Novae	236
11.	Topics Related to the Evolution of CV Systems	238
11.1	The Period Gap	238
11.1.1	Angular Momentum Loss Mechanisms	238
11.1.2	The Cause for the Period Gap	241
11.2	Can Cataclysmic Variables Produce Accretion Induced Collapses or Type I Supernovae?	243
11.2.1	Recurrent Novae	243

Interacting Binaries: Topics in Close Binary Evolution

By Edward P.J. van den Heuvel (With 92 Figures)

1. Summary and Introduction	263
2. Mechanical Aspects of Mass Transfer and Mass Loss in Binary Systems	266
2.1 Shape of the Two Stars in the Roche Approximation	266
2.2 Limitations of the Roche-concept	267
2.3 Orbital Changes Due to Mass Transfer and Mass Loss in Binary Systems	269
3. Properties of Important Classes of Interacting Binaries	282
3.1 Introduction	282
3.2 Interacting Binaries as Classified by the Evolutionary Status of the Components	286
3.3 Evolved Systems with Non-degenerate Components	287
3.4 Evolved Systems with One or Two White Dwarf Component(s) ..	290
3.5 Evolved Systems with Neutron Star and Black Hole Components	295
3.6 Binary Radio Pulsars and Related Objects	327
4. Overview of the Evolution of Single Stars	338
4.1 Why Stars Shine and Evolve: the Virial Theorem	338
4.2 The Onset of Nuclear Burning: the Hydrogen-Burning Station ..	340
4.3 The Three Basic Stellar Timescales	341
4.4 Evolution Beyond Hydrogen Burning	342
4.5 The Variation of the Outer Radius and Luminosity During Stellar Evolution	346
4.6 Final Evolution of Stars in the Mass Range 3–8 $M_{\odot}$: Competition Between Carbon Deflagration and Mass Loss; Evidence from White Dwarfs in Clusters	346
4.7 Final Evolution of Stars More Massive Than About 8 $M_{\odot}$	347
4.8 The Evolution of Helium Stars	349
4.9 Discussion: the Effect of Convective Overshooting	352
5. Evolution of Close Binaries with Mass Exchange	352
5.1 Introduction	352
5.2 Changes in Orbital Period and Separation During “Conservative” Mass Transfer	355
5.3 Response of the Stellar Radius to Mass Loss	356
5.4 Reasons for the Large Scale Mass Transfer During the Evolution of a Close Binary	360
5.5 Some Examples of the Results of Detailed Calculations of Close Binary Evolution with Mass Transfer	361
5.6 Comparison with the Observations	370
6. Highly Non-conservative Evolution	386
6.1 Introduction	386

6.2	Reasons for the Occurrence of Highly Non-conservative Evolution and of a Common-Envelope Phase	387
6.3	Tidal Instability	388
