

Contents

1 Introduction	1
2 Reduction of Low-Energy QCD to QFD	5
2.1 Effective Low-Energy Quark Interaction	5
2.2 Invariance Properties of QCD and QFD	10
2.3 Fierz-Transformation of the Effective Quark Interaction . . .	13
3 The Effective Meson Theory	17
3.1 Functional Integral Bosonization of the Quark-Antiquark Interaction	17
3.2 Small-Amplitude Expansion of the Action	20
3.3 Dynamical Breaking of Chiral Symmetry	23
3.4 The Bethe-Salpeter Equation for Pseudoscalar Mesons	29
3.5 The Gauged Linear σ Model	32
3.6 Recovering the Skyrme Model	37
3.7 Chiral Anomaly	39
3.7.1 Non-invariance of the Path Integral Measure	39
3.7.2 Some Remarks on the Chiral Anomaly	43
3.7.3 The Wess-Zumino-Witten Action	45
<i>Summary</i>	47
4 Baryons as Chiral Solitons	49
4.1 Basic Aspects of the Skyrmion	49
4.2 Diving into the Dirac Sea	51
4.3 The Energy Functional of the NJL Soliton for Static Meson Fields	53
4.4 The Static NJL Soliton	57

4.5 Semiclassical Quantization	63
4.6 Meson Fluctuations off the Soliton	66
4.7 Zero Modes	70
4.8 Quantum Corrections to the Soliton Mass	72
4.9 Hyperons	74
4.9.1 Collective Approach	74
4.9.2 Bound State Approach	77
<i>Summary</i>	83
5 Baryons as Bound States of Diquarks and Quarks	85
5.1 Functional Integral Hadronization	85
5.2 Diquarks	89
5.3 The Relativistic Faddeev Equation for Baryons	93
<i>Summary</i>	99
6 On the Description of Baryons: An Outlook	100
Appendix A: Covariant Gradient Expansion	102
Appendix B: Topological Properties of the Chiral Field	105
Appendix C: Equations of Motion for the NJL Soliton Meson Profiles	108
References	110
List of Figures	113
List of Tables	115
