Part I Relativistic Effects in Interatomic Ionization Processes

1 Introduction and Preliminary Remarks	3
1.1 Historical Background and Motivation	3
1.2 Overview of Direct and Two-Center Impact and Photoionization Mechanisms	6
1.3 Relativistic Effects in Two-Center Impact and Photoionization	8
2 Ionization of a Weakly Bound Diatomic System by Relativistic Charged Projectiles	13
2.1 Theoretical Consideration	13
2.1.1 General Approach	13
2.1.2 Amplitude for Two-Center Impact Ionization of Atom A	19
2.1.3 Amplitudes for Direct Impact Ionization of Atoms A and B	25
2.1.4 Cross Sections for Impact Ionization of Atom A	27
2.1.5 Cross Section for Impact Ionization of Atom B	29
2.1.6 Analytical Cross Sections for Two-Center Impact Ionization	30
2.2 Numerical Results and Discussion	33
2.2.1 Properties of the Relativistic Charged Projectiles	34
2.2.2 Properties of the Diatomic Targets: The Li–He and Ne–He Dimers	34
2.2.3 Analytical Cross Sections for He, Li and Ne	36
2.2.4 Angular Distributions	37

2.2.5	Energy Distributions	40
2.2.6	Total Cross Sections	42
2.2.7	Retardation Effect in Two-Center Impact Ionization	46
2.3	Summary and Concluding Remarks	48
3	Radiation- Field-Driven Ionization in Laser-Assisted Slow	
	Atomic Collisions	51
3.1	Theoretical Consideration	51
3.1.1	The Coupling to the Radiation Field	51
3.1.2	General Approach	54
3.1.3	Field-Dressed States of Atom <i>B</i> Interacting with a Resonant Laser Field	56
3.1.4	Amplitude for Two-Center Photoionization Via Coupling to the Radiation Field	58
3.1.5	Cross Section and Reaction Rate for Two-Center Photoionization Via Coupling to the Radiation Field	72
3.2	Numerical Results and Discussion	76
3.2.1	Two-Center Photoionization Via Two-Center Autoionization	76
3.2.2	Two-Center Photoionization Via Coupling to the Radiation Field vs. Two-Center Photoionization Via Two-Center Autoionization	78
3.2.3	Two-Center Photoionization vs. Direct Photoionization	79
3.2.4	Experiments on Two-Center Photoionization	81
3.2.5	Two-Center Photoionization and the Breit Interaction	82
3.2.6	Ionization at Larger Collision Velocities	83
3.3	Summary and Concluding Remarks	83
Part II	Formation of Antimatter Ions in Interatomic Attachment Reactions	
4	Introduction and Preliminary Remarks	89
4.1	Historical Background and Motivation	89
4.2	Overview of $\bar{\text{H}}^+$ Formation Mechanisms	91
4.3	The Bound State of $\bar{\text{H}}^+$	93

5	Theory of Radiative Attachment	95
5.1	Spontaneous Radiative Attachment	95
5.2	(Laser-)induced Radiative Attachment	99
5.3	Two-Center Dileptonic Attachment	107
6	Theory of Nonradiative Attachment	111
6.1	Electron-assisted Three-body Attachment	111
6.2	Positron-assisted Three-body Attachment	122
7	Numerical Results and Discussion	125
7.1	Comparative Analysis of the Radiative and Nonradiative Attachment Mechanisms	125
7.1.1	Spontaneous Radiative vs. Two-Center Dileptonic vs. Electron-assisted Three-body Attachment	125
7.1.2	Spontaneous vs. (laser-)induced Radiative Attachment	128
7.1.3	Electron-assisted vs. Positron-assisted Three-body Attachment	129
7.1.4	Electron-assisted Three-body Attachment vs. $\text{Ps} - \bar{\text{H}}$ Charge Exchange Collision	130
7.2	The Role of Annihilation and other Processes Related to the Interaction between Matter and Antimatter	131
7.2.1	Two-Center Dileptonic Attachment in an Environment Consisting of Matter and Antimatter	131
7.2.2	Electron-assisted Three-body Attachment in an Environment Consisting of Matter and Antimatter	133
8	Summary and Concluding Remarks	135
	Bibliography	139
