Acknowledgment — VII

Preface — IX

Part I: **Foundations and examples of complex heterogeneous systems**

1 Introduction and motivation — 3
1.1 Notation, definitions, and dimensionless formulations — **11**

2 Fundamental building blocks for CHeSs — 16
2.1 Thermodynamic principles as a systematic pillar — **16**
2.1.1 Key concepts: system, heat, work, energy, and entropy — **16**
2.1.2 Efficiency: heat engines and generalizations — **26**
2.1.3 Fluctuations — **30**
2.2 Complexity — **33**
2.2.1 McCabe's complexity: cyclomatic complexity — **35**
2.3 Algorithmic Information Content (AIC) — **38**
2.3.1 The Turing machine — **38**
2.3.2 Definition of AIC — **39**
2.4 Networks and graphs: from the theory of systems to CHeSs — **41**
2.5 From thermodynamics to information — **44**
2.5.1 Maxwell's demon — **46**
2.6 Percolation: criticality and phase transitions — **48**
2.7 Nonequilibrium CHeSs: GENERIC and Variational Principles — **51**
2.7.1 Attempts inspired by GENERIC: dilute solutions from minimal energy and maximum dissipation — **52**
2.8 Smart Interacting CHeSs: autonomy, decision, strategy, and learning — **53**
2.8.1 Learning interaction strategies: the fictitious play — **74**
2.8.2 Framework for decision dynamics: kinematic evolution and utility functions — **82**

3 Examples of CHeSs: toward reliable and systematic descriptions — 88
3.1 Nonequilibrium CHeSs: transport in solids — **88**
3.1.1 Applications and limits of phase field formulations — **92**
3.2 Universal CHeSs: coarsening in heterogeneous media — **93**
3.2.1 Interfacial dynamics in heterogeneous media: coarsening rates — **93**
3.3 Information/data processing systems as CHeSs: from PC over DC and HPC to QC — **98**

Bibliografische Informationen
https://d-nb.info/1309431906

digitalisiert durch DEUTSCHE NATIONAL BIBLIOTHEK

3.3.1 PC as a CHeS — **98**
3.3.2 DC as a CHeS — **100**
3.3.3 HPC as a CHeS — **102**
3.3.4 QC as a CHeS — **103**

4 CHeSs and measurements: state and parameter estimation — 105
4.1 CHeS identification and description: stochastic models and filters — **105**
4.1.1 CHeSs as stochastic input/output models — **105**
4.1.2 CHeSs as a filter — **112**
4.2 Concepts of parameter estimation — **113**
4.2.1 Least Squares Estimator (LSE) — **114**
4.2.2 Maximum Likelihood Estimator (MLE) — **125**
4.3 State prediction of CHeSs by measurements: Kalman filter — **128**
4.3.1 The Kalman filter problem formulation — **129**
4.3.2 The discrete-time Kalman filter algorithm — **131**
4.3.3 Derivation of the discrete-time Kalman filter — **132**

5 Reliability and degradation in CHeSs — 134
5.1 Introduction — **134**
5.2 Fundamental concepts — **135**
5.3 Serial arrangement: *N* independent systems — **136**
5.4 Parallel arrangement: *N* independent systems — **137**
5.5 Reliability in CHeSs: serial and parallel combinations — **138**
5.5.1 Software reliability — **139**

6 Multiscale CHeSs: upscaling, effective properties, and macroscopic descriptions — 142
6.1 Introduction — **142**
6.2 Network/graph-based upscaling: flow/circuit laws — **142**
6.3 Upscaling based on homogenization theory: asymptotic two-scale expansion — **145**
6.4 Properties of the effective conductivity tensor (6.22) — **148**
6.4.1 (A) Symmetry and positive definiteness — **148**
6.4.2 (B) Simple upper and lower bounds — **150**
6.5 Upscaling for slowly varying microstructure — **155**
6.6 Hydraulic conductivity: Darcy's law — **157**
6.6.1 Stokes flow through deterministic pore spaces: formal derivation — **157**
6.7 Convection diffusion problems — **160**
6.8 CHeSs showing fractal designs: theory and examples — **162**
6.8.1 Characterizations of fractals and generalizations to CHeSs — **164**
6.8.2 Investigating fractal CHeSs — **172**

6.8.3 Cross-shaped fractals: Surface areas, porosities, and capacities in CHeSs — **172**

7 Quantum algorithms describing CHeSs — 177
7.1 Introduction — **177**
7.2 Mathematical framework for quantum systems — **177**
7.3 Solving multiscale problems on a quantum computer — **178**
7.3.1 Quantum algorithms required for multiscale problems — **179**
7.3.2 Multiscale problems' benefit from quantum computers — **190**

8 Electrochemical CHeSs — 195
8.1 Energy storage and fuel cell systems — **195**
8.1.1 CHeSs describing energy storage systems — **195**
8.1.2 Fuel cell systems representing electrochemical CHeSs — **196**
8.2 Optimal material design as interacting CHeSs — **199**
8.3 Battery modeling — **205**
8.3.1 Thermodynamic consistency: nonequilibrium formulation for electrolytes — **206**
8.3.2 System (8.16) satisfies the principles of GENERIC — **209**
8.3.3 Examples belonging to system (8.16) — **211**
8.3.4 Charge transport formulations for Li-batteries — **214**
8.3.5 Fundamental and Self-consistent Battery Equations (FSBEs): binary and neutrally dilute electrolytes with active Li-hosts — **218**
8.3.6 Two-phase composite Li-battery — **218**
8.3.7 Current-driven FSBE: linearization and 1D analytic solutions — **226**
8.3.8 Nonlinear and self-consistent Li-transport in concentrated polymer solutions — **231**

Part II: **Rigorous mathematical methods: CHeSs relevant applications**

9 Electrochemical CHeSs: from well-posedness to battery failure/blow-up — 239
9.1 Well-posedness of a binary electrolyte for $\mathbf{v} = 0$ — **239**
9.1.1 Conditions for blow-up in finite time — **243**

10 Rigorous upscaling of CHeSs: the two-scale convergence method — 247
10.1 Introduction — **247**
10.2 The classical two-scale convergence method — **248**
10.2.1 Two-scale convergence of conductivity problems — **250**

11 CHeSs governed by interparticle forces — 254
11.1 Introduction — **254**
11.2 Upscaling of a hard-sphere particle system — **254**
11.2.1 Main results: effective macroscopic transport in strongly heterogeneous materials — **257**
11.2.2 Proof of the main results — **258**
11.3 Locating obstacles in transport problems: forward and inverse problems — **260**
11.3.1 Forward problem $\mathcal{F}$ — **261**
11.3.2 Inverse problem $\mathcal{I}$ — **262**
11.3.3 Data inferred barycenter: optimality constraints — **263**
11.4 Computational method: constrained gradient descent — **266**
