

Table of Contents

Chapter 1. Global Stability and Uniqueness	7
§ 1. The Initial Value Problem and Stability	7
§ 2. Stability Criteria—the Basic Flow	9
§ 3. The Evolution Equation for the Energy of a Disturbance	11
§ 4. Energy Stability Theorems	13
§ 5. Uniqueness	21
Notes for Chapter I	23
(a) The Reynolds Number	23
(b) Bibliographical Notes	23
 Chapter II. Instability and Bifurcation	 25
§ 6. The Global Stability Limit	25
§ 7. The Spectral Problem of Linear Theory	25
§ 8. The Spectral Problem and Nonlinear Stability	30
§ 9. Bifurcating Solutions	32
§ 10. Series Solutions of the Bifurcation Problem	34
§ 11. The Adjoint Problem of the Spectral Theory	37
§ 12. Solvability Conditions	39
§ 13. Subcritical and Supercritical Bifurcation	41
§ 14. Stability of the Bifurcating Periodic Solution	43
§ 15. Bifurcating Steady Solutions; Instability and Recovery of Stability of Subcritical Solutions	48
§ 16. Transition to Turbulence by Repeated Supercritical Bifurcation	52
Notes for Chapter II	54
 Chapter III. Poiseuille Flow: The Form of the Disturbance whose Energy Increases Initially at the Largest Value of ν	 64
§ 17. Laminar Poiseuille Flow	65
§ 18. The Disturbance Flow	66
§ 19. Evolution of the Disturbance Energy	68
§ 20. The Form of the Most Energetic Initial Field in the Annulus	69
§ 21. The Energy Eigenvalue Problem for Hagen-Poiseuille Flow	72

§ 22. The Energy Eigenvalue Problem for Poiseuille Flow between Concentric Cylinders	76
(a) Parabolic Poiseuille Flow	76
(b) Poiseuille Flow in an Annular Pipe	78
§ 23. Energy Eigenfunctions—an Application of the Theory of Oscillation kernels	78
§ 24. On the Absolute and Global Stability of Poiseuille Flow to Disturbances which are Independent of the Axial Coordinate	81
§ 25. On the Growth, at Early Times, of the Energy of the Axial Component of Velocity	84
§ 26. How Fast Does a Stable Disturbance Decay	85
 Chapter IV. Friction Factor Response Curves for Flow through Annular Ducts	 90
§ 27. Response Functions and Response Functionals	90
§ 28. The Fluctuation Motion and the Mean Motion	92
§ 29. Steady Causes and Steady Effects	97
§ 30. Laminar and Turbulent Comparison Theorems	98
§ 31. A Variational Problem for the Least Pressure Gradient in Statistically Stationary Turbulent Poiseuille Flow with a Given Mass Flux Discrepancy	100
§ 32. Turbulent Plane Poiseuille Flow—a Lower Bound for the Response Curve	103
§ 33. The Response Function Near the Point of Bifurcation	106
§ 34. Construction of the Bifurcating Solution	109
(a) The Spectral Problem	109
(b) The Perturbation Series	112
(c) Some Properties of the Bifurcating Solution	118
§ 35. Comparison of Theory and Experiment	119
(a) Instability of Laminar Poiseuille Flow	120
(b) Description of the Diagrams	122
(c) Inferences and Conjectures	124
Notes for Chapter IV	127
 Chapter V. Global Stability of Couette Flow between Rotating Cylinders	 130
§ 36. Couette Flow, Taylor Vortices, Wavy Vortices and Other Motions which Exist between the Cylinders	130
§ 37. Global Stability of Nearly Rigid Couette Flows	132
§ 38. Topography of the Response Function, Rayleigh's Discriminant	136
§ 39. Remarks about Bifurcation and Stability	141
§ 40. Energy Analysis of Couette Flow; Nonlinear Extension of Synge's Theorem	146
§ 41. The Optimum Energy Stability Boundary for Axisymmetric Disturbances of Couette Flow	153
§ 42. Comparison of Linear and Energy Limits	155

Chapter VI. Global Stability of Spiral Couette-Poiseuille Flows	158
§ 43. The Basic Spiral Flow. Spiral Flow Angles	159
§ 44. Eigenvalue Problems of Energy and Linear Theory	163
§ 45. Conditions for the Nonexistence of Subcritical Instability	171
§ 46. Global Stability of Poiseuille Flow between Cylinders which Rotate with the Same Angular Velocity.	172
§ 47. Disturbance Equations for Rotating Plane Couette Flow	178
§ 48. The Form of the Disturbance Whose Energy Increases at the Small- est R	180
§ 49. Necessary and Sufficient Conditions for the Global Stability of Rotating Plane Couette Flow.	186
§ 50. Rayleigh's Criterion for the Instability of Rotating Plane Couette Flow, Wave Speeds	189
§ 51. The Energy Problem for Rotating Plane Couette Flow when Spiral Disturbances are Assumed from the Start	191
§ 52. Numerical and Experimental Results	197
Chapter VII. Global Stability of the Flow between Concentric Rotating Spheres	202
§ 53. Flow and Stability of Flow between Spheres	202
(a) Basic Flow	202
(b) Stability Analysis	206
(c) Experimental and Numerical Results	210
Appendix A. Elementary Properties of Almost Periodic Functions	218
Appendix B. Variational Problems for the Decay Constants and the Stability Limit	221
B 1. Decay Constants and Minimum Problems	221
B 2. Fundamental Lemmas of the Calculus of Variations	223
B 3. The Eigenvalue Problem for the Decay Constants $\hat{A}_1(\nu, \kappa)$	224
B 4. Domain and Transfer Constant (κ) dependence of the Decay Constants	227
B 5. The Decay Constant $\hat{A}_1$ in a Box	231
B 6. Representation Theorem for Solenoidal Fields	233
B 7. The Decay Constant $\hat{A}_1$ in the Spherical Annulus with $\mathbf{u}=0 _s$	237
B 8. The Energy Eigenvalue Problem	240
B 9. The Eigenvalue Problem and the Maximum Problem	242
Notes for Appendix B.	243
Appendix C. Some Inequalities	244
Appendix D. Oscillation Kernels	251
Appendix E. Some Aspects of the Theory of Stability of Nearly Parallel Flow	256
E 1. Orr-Sommerfeld Theory in a Cylindrical Annulus	256
E 2. Stability and Bifurcation of Nearly Parallel Flows	264
References	267
Subject Index	278

Contents of Part II

Chapter VIII. The Oberbeck-Boussinesq Equations.

The Stability of Constant Gradient Solutions of the Oberbeck-Boussinesq Equations

§ 54. The Oberbeck-Boussinesq Equations for the Basic Flow

§ 55. Boundary Conditions

(a) Temperature Conditions

(b) Concentration Boundary Conditions

(c) Velocity Boundary Conditions

§ 56. Equations Governing Disturbances of Solutions of the OB Equations

§ 57. The λ Family of Energy Equations

§ 58. Kinematic Admissibility, Sufficient Conditions for Stability

§ 59. Motionless Solutions of the Oberbeck-Boussinesq Equations

§ 60. Physical Mechanisms of Instability of the Motionless State

§ 61. Necessary and Sufficient Conditions for Stability

§ 62. The Bénard Problem

§ 63. Plane Couette Flow Heated from below

§ 64. The Buoyancy Boundary Layer

Chapter IX. Global Stability of Constant Temperature-Gradient and Concentration-Gradient States of a Motionless Heterogeneous Fluid

§ 65. Mechanics of the Instability of the Conduction-Diffusion Solutions in a Motionless Heterogeneous Fluid

§ 66. Energy Stability of Heated below and Salted above

§ 67. Heated and Salted from below: Linear Theory

§ 68. Heated and Salted below: Energy Stability Analysis

§ 69. Heated and Salted below: Generalized Energy Analysis

Addendum for Chapter IX: Generalized Energy Theory of Stability for Hydromagnetic Flows

Chapter X. Two-Sided Bifurcation into Convection

§ 70. The DOB Equations for Convection of a Fluid in a Container of Porous Material

- § 71. The Spectral Problem, the Adjoint Spectral Problem and the Energy Theory of Stability
- § 72. Two-Sided Bifurcation
 - (a) Simple Eigenvalue
 - (b) Multiple Eigenvalues
 - (c) Stability of Bifurcating Solutions at Eigenvalues of Higher Multiplicity
- § 73. Conditions for the Existence of Two-Sided Bifurcation
 - (a) Axisymmetric Convection in Round Containers
 - (b) Nonaxisymmetric Convection in Round Containers
 - (c) Convection in a Hexagonal Container
 - (d) Stability of Solutions Bifurcating at an Eigenvalue of Multiplicity N
 - (e) Stability of Bifurcating Hexagonal Convection
 - (f) One-Sided Convection in Containers of Rectangular Cross-Section
 - (g) The Bénard Problem for a DOB Fluid in a Container
- § 74. Two-Sided Bifurcation between Spherical Shells
- § 75. Stability of the Conduction Solution in a Container Heated below and Internally
- § 76. Taylor Series in Two Parameters
- § 77. Two-Sided Bifurcation in a Laterally Unbounded Layer of Fluid
 - (a) Spectral Crowding
 - (b) Cellular Convection
 - (c) Stability and the Sign of the Motion in Cellular Convection
- Addendum to Chapter X: Bifurcation Theory for Multiple Eigenvalues
 - (a) Membrane Eigenvalues Perturbed by a Nonlinear Term
 - (b) Bifurcation from a Simple Eigenvalue
 - (c) Bifurcation from a Multiple Eigenvalue
 - (d) The Orthogonal Decomposition
 - (e) Solvability Conditions
 - (f) Perturbation of a Linear Problem at a Double Eigenvalue
 - (g) Bifurcation from a Double Eigenvalue: An Example where the Initiating Solvability Condition Occurs at Order $l=1$ ($\lambda_1 \neq 0$)
 - (h) Bifurcation from a Double Eigenvalue: An Example where the Initiating Solvability Condition Occurs at Order $l=2$ ($\lambda_1=0, \lambda_2 \neq 0$)

Chapter XI. Stability of Supercritical Convection-Wave Number Selection Through Stability

- § 78. Statistically Stationary Convection and Steady Convection
- § 79. Stability of Rolls to Noninteracting Three-Dimensional Disturbances
- § 80. Nonlinear Neutral Curves for Three-Dimensional Disturbances of Roll Convection
 - (a) Oblique-Roll and Cross-Roll Instabilities
 - (b) Varicose Instabilities
 - (c) Sinuous Instabilities
- § 81. Computation of Stability Boundaries by Numerical Methods
- § 82. The Amplitude Equation of Newell and Whitehead

Chapter XII. The Variational Theory of Turbulence Applied to Convection in Porous Materials Heated from below

- § 83. Bounds on the Heat Transported by Convection
- § 84. The Form of the Admissible Solenoidal Fluctuation Field Which Minimizes $\mathcal{F}[\mathbf{u}, \theta; \mu]$
- § 85. Mathematical Properties of the Multi- α Solutions
- § 86. The single- α Solution and the Situation for Small μ
- § 87. Boundary Layers of the Single- α Solution
- § 88. The Two- α Solution
- § 89. Boundary-Layers of the Multi- α Solutions
- § 90. An Improved Variational Theory Which Makes Use of the Fact that B is Small
- § 91. Numerical Computation of the Single- α and Two- α Solution. Remarks about the Asymptotic Limit $\mu \rightarrow \infty$
- § 92. The Heat Transport Curve: Comparison of Theory and Experiment

Chapter XIII. Stability Problems for Viscoelastic Fluids

- § 93. Incompressible Simple Fluids. Functional Expansions and Stability
 - (a) Functional Expansions of $\mathcal{F}$, Stability and Bifurcation
 - (b) Generation of the History of Motion
 - (c) Stability and Bifurcation of Steady Flow
- § 94. Stability and Bifurcation of the Rest State
 - (a) Slow Motion
 - (b) Time-Dependent Perturbations of the Rest State
 - (c) Stability of Rest State
 - (d) Bifurcation of the Rest State of a Simple Fluid Heated from below
- § 95. Stability of Motions of a Viscoelastic Fluid
 - (a) The Climbing Fluid Instability
 - (b) Symmetry Breaking Instabilities of the Time-Periodic Motion Induced by Torsional Oscillations of a Rod
 - (c) The Striping Instability
 - (d) Tall Taylor Cells in Polyacrylamide

Chapter XIV. Interfacial Stability

- § 96. The Mechanical Energy Equation for the Two Fluid System
- § 97. Stability of the Interface between Motionless Fluids When the Contact Line is Fixed
- § 98. Stability of a Column of Liquid Resting on a Column of Air in a Vertical Tube—Static Analysis
- § 99. Stability of a Column of Liquid Resting on a Column of Air in a Vertical Tube—Dynamic Analysis

Notes for Chapter XIV
