

Contents

1. Introduction	1
1.1 Chaotic Dynamics	2
1.2 Noise-Induced Complex Patterns	4
1.3 Chaos and Self-Organization	6
2. Unpredictable Dynamics	9
2.1 Hamiltonian Systems	9
2.2 Destruction of Tori	16
2.3 Ergodicity and Mixing	21
3. Strange Attractors	29
3.1 Dissipative Systems and Their Attractors	29
3.2 The Lorenz Model	35
3.3 Lyapunov Exponents	41
3.4 The Autocorrelation Function	45
4. Fractals	50
4.1 Self-Similar Patterns	50
4.2 Dimensions	54
4.3 Fractal Dimensions of Strange Attractors	56
5. Discrete Maps	60
5.1 Fixed Points and Cycles	60
5.2 Chaotic Maps	65
5.3 Feigenbaum Universality	68
6. Routes to Temporal Chaos	73
6.1 Bifurcations	73
6.2 The Ruelle-Takens Scenario	75
6.3 Period Doubling	78
6.4 Intermittency	80
7. Spatio-Temporal Chaos	85
7.1 Embedding Dimensions	85

7.2	Phase Turbulence	91
7.3	Coupled Chaotic Maps	95
8.	Random Processes	106
8.1	Probabilistic Automata	106
8.2	Continuous Random Processes	111
8.3	The Fokker-Planck Equation	117
9.	Active Systems with Noise	120
9.1	Generalized Brownian Motion	120
9.2	Internal Noise	126
9.3	Optimal Fluctuations	132
10.	Population Explosions	138
10.1	Mean Ignition Time of Explosion	138
10.2	Intermittency of Growth	142
10.3	Breeding Centers	149
11.	Extinction and Long-Time Relaxation	153
11.1	Random Traps	153
11.2	Irreversible Annihilation	156
11.3	Conserved Quantities and Long-Time Relaxation	162
11.4	Stochastic Segregation and the Sub-Poissonian Distribution	165
12.	Catastrophes	170
12.1	Second-Order Phase Transitions	171
12.2	Sweeping Through the Critical Region	176
12.3	The Biased Transition	180
12.4	Population Settling-Down	186
12.5	Survival in the Fluctuating Environment	192
