

Table of contents

Foreword	VI
Editors' foreword	VII
Acknowledgements	IX
Contributors	X
The history of osteotomy	XIII
Indications and planning	I
1 Physiological axes of the lower limb	5
2 Clinical and radiological evaluation	15
3 Indications for high-tibial osteotomy, unicondylar knee arthroplasty, and total knee prosthesis	19
4 Basic principles of osteotomies around the knee	29
5 Detailed planning algorithm for high-tibial osteotomy	39
Clinical applications	49
6 High-tibial closed-wedge osteotomy	55
7 Principles of angular stable fixators	59
8 Biomechanical testing of different plates	71
9 High-tibial open-wedge valgization osteotomy with plate fixator	87
10 Effect of osteotomies on cartilage pressure in the knee	105
11 Osteotomy and ligament instability: tibial slope corrections and combined procedures around the knee joint	117
12 Radiological examination of bone healing after open-wedge tibial osteotomy	131
13 Supracondylar varization osteotomy of the femur with plate fixation	147
14 Double osteotomies of the femur and the tibia	167
15 Rotational osteotomies of the femur and the tibia	185
16 Total knee arthroplasty after osteotomy around the knee	209
17 Management of complications after high-tibial open-wedge osteotomy	223
18 Osteotomies for failed osteotomies around the knee	233
Future developments	251
19 Computer-assisted navigation in proximal tibial osteotomy	253
20 Development of plate fixators: current status and perspectives	263
Appendix	271
Glossary	273
Abbreviations	277
