1	Equilibrium Statistical Physics	1
1.1	Microscopic Dynamics of a Physical System	1
1.1.1	A Particle Attached to a Spring	1
1.1.2	Many-Particle System	5
1.1.3	Case of Discrete Variables: Spin Models	5
1.2	Statistical Description of an Isolated System at Equilibrium	6
1.2.1	Notion of Statistical Description: A Toy Model	6
1.2.2	Fundamental Postulate of Equilibrium Statistical Physics	7
1.2.3	Computation of $\Omega(E)$ and $S(E)$: Some Simple Examples	8
1.2.4	Distribution of Energy Over Subsystems and Statistical Temperature	10
1.3	Equilibrium System in Contact with its Environment	12
1.3.1	Exchanges of Energy	12
1.3.2	Canonical Entropy	15
1.3.3	Exchanges of Particles with a Reservoir: The Grand-Canonical Ensemble	17
1.4	Phase Transitions	18
1.4.1	Example of the Ising Model	18
1.4.2	Ising Model in Fully Connected Geometry	18
1.4.3	Ising Model with Finite Connectivity	21
1.4.4	Renormalization Group Approach: A Brief Introduction	22
1.5	Disordered Systems and Glass Transition	27
1.5.1	Disorder in Complex Systems: From Social Sciences to Spin-Glasses	27

1.5.2	Theoretical Spin-Glass Models	28
1.5.3	The Simplest Disordered System: The Random Energy Model.	28
	References	31
2	Non-Stationary Dynamics and Stochastic Formalism	33
2.1	Markovian Stochastic Processes and Master Equation	33
2.1.1	Definition of Markovian Stochastic Processes.	33
2.1.2	Master Equation and Detailed Balance	35
2.1.3	Dynamical Increase of the Entropy	37
2.1.4	A Simple Example: The One-Dimensional Random Walk	38
2.2	Langevin and Fokker–Planck Equations	41
2.2.1	Phenomenological Approach to the Langevin Equation	41
2.2.2	Relation to Random Walks	45
2.2.3	Fokker–Planck Equation	47
2.3	Anomalous Diffusion and Physical Aging	49
2.3.1	Generalized Central Limit Theorem	49
2.3.2	Anomalous Diffusion.	52
2.3.3	Aging Dynamics and Trap Models	54
