Contents

Volume 1

	Page
1. Introduction	1
1.1 Abbreviations and definitions	3
References for Chapter 1.	3
2. The Standardization of Crystal Structure Data	5
2.1. Why do we need standardized structure data?	5
2.2. How do we standardize?	9
2.21. The standardization procedure	9
The 230 space groups in standard setting and the conditions, criteria and space group properties which have to be considered in the standardization process (Table 2-1)	13
2.22. Example for the different possible descriptions of a structure which have to be considered in the standardization procedure	21
The 24 possible settings for $Zr_2Fe_{12}P_7$ in space group *(174) P-6* (Table 2-2)	22
2.23. Change of space group	23
List of structures where additional symmetry elements were detected (Table 2-3)	24
2.24. Notations for absolute configuration	28
2.25. Practical considerations – the STRUCTURE TIDY program	29
List of space groups in particular settings and letters of those Wyckoff sites for which differences are observed between the 1952 and 1983 editions of the International Tables for (X-Ray) Crystallography (Table 2-4)	32
2.3. What can we do with standardized structure data?	33
2.31. Recognition of isotypic structures	33
2.32. The Wyckoff sequence, the Γ and CG values and their use for the classification of structure types	35
Structures with Pearson code *oP20*, classified according to space group, Wyckoff sequence and CG parameter (Table 2-5)	37
2.33. The similarity of the Wyckoff sequence as an indication to possible structural relationships	39
References for Chapter 2.	40
3. Crystal Chemical Characterization of Inorganic Structure Types	41
A: Structures with close packed layers	
A11: Close packed structures	42
A21: Trigonal and hexagonal sandwich structures	49
B: Structures of compounds where valence electron considerations can be applied	
B11: Binary structure types with polyanions	57
B21: Normal adamantane structure types	66
B22: ZnS and SiC polytypes	69

Bibliografische Informationen

digitalisiert durch DEUTSCHE NATIONAL BIBLIOTHEK

Page

B23: Defect adamantane structure types 73
B24: Binary tetrahedral structures with homonuclear bonds 75
B25: Structure types with cage molecules 77

B31: Structures with (anionic) tetrahedron complexes 78
B32: Structure types with anionic triangle complexes 99
B33: Hydrides with anionic complexes 101

B41: Sulphosalts and related compounds 104
B42: Sulphosalts with NaCl- and/or GeS-type segments 117
B43: Lillianite structure series 128
B44: Pavonite structure series 132
B45: Meneghinite structure series 134
B46: Sartorite structure series 136
B47: Sulphosalts with homonuclear bonds 138

B51: Structure types with octahedral metal clusters 140
B52: 'Chimney ladder' structures 143

C: Structures with intergrown slabs

C11: Ruddlesden-Popper phases, an intergrowth of NaCl- and $CaTiO_3$-type slabs 145

C21: Linear intergrowth of Laves- and $CaCu_5$-type slabs 147
C22: Linear intergrowth of $CaCu_5$- and $CeCo_3B_2$-type slabs 151
C23: Linear intergrowth of Ba_3Al_5- and Laves-type slabs 152
C24: Linear intergrowth of $CeAl_2Ga_2$- and $CeCo_3B_2$-type slabs 153
C25: Linear intergrowth of $YNiAl_4$- and $R_2T_4Al_{15}$-type slabs 154

C31: CrB (or TlI)-FeB stacking variants 156
C32: Linear intergrowth of CrB (or TlI)- and YAlGe-type slabs 159
C33: Linear intergrowth of $CeAl_2Ga_2$-, W- and CrB (or TlI)-type slabs 160

C41: Linear intergrowth structures with square mesh interfaces 161

C51: Structure types related to W_5Si_3 168

D: Structures with intergrown columns or blocks

D11: Intergrowth of Laves- and Zr_4Al_3-type columns 169
D12: T_3A types with columns of fused tetrahedron stars 171
D13: Structure types with antiprism and octahedron columns 172

D21: Intergrowth of nested polyhedra units 174
D22: Intergrowth of $CaCu_5$- and Zr_4Al_3-type segments 177

E: Structures with particular atom coordinations and linkages

E11: Structure types with linear *A*-*C'*-*A* groups 181
E12: Structure types with square planar anion complexes 183

E21: Structure types with Frank-Kasper polyhedra 185
E22: Friauf-Laves phase polytypes 188

E31: Structures containing icosahedrally arranged polyhedra 191

E41: Elementary boron and boron-rich phases 194
E42: Boron aggregation in borides 198
E43: Boron-carbon aggregation in borocarbides 205
E44: Ternary borides and homologues with two-layer structures 207

E51: $(T,T')_{\sim 2}M$ types with *M* atoms in trigonal prismatic coordination 217
E52: Binary structure types built up of centred trigonal prisms 224
E61: Octahedron linkage in pnictides with composition TA_4 229

Page

F: Deformation, substitution, filled-up and vacancy derivatives

F11: Pyrite, marcasite, pararammelsbergite and derivatives 231

F21: Substitution derivatives of Fe_2P 233

F22: Deformation, substitution and vacancy derivatives of AlB_2 234

F23: Deformation and substitution derivatives of $BaAl_4$ 242

F24: Binary and ternary deformation derivatives of Rh_5Ge_3 245

F25: Deformation variants of $CeCo_3B_2$ 247

F31: Interstitial hydrides 249

F41: Deformation and substitution derivatives of W and CsCl 257

F42: Simple derivatives of Cu_2Sb and Ti_2Bi 259

Volume 2

4. Cross-Reference Tables 261

4.1. Colloquial Name-Table 262

4.2. Pearson Code-Table 269

4.3. Strukturbericht-Table 363

4.4. Space Group-Table 372

4.5. Stoichiometry-Table 462

4.6. Type Formula-Table 548

Volumes 3 and 4

5. Explanatory Notes for the Use of the Main Data-Table

5.1. How to find the data for a particular structure type?

5.2. Explanation of the records

5.3. Expressions used to describe atom coordinations
Symbols for commonly observed coordination polyhedra (Table 5-1)

5.4. Notations for defining structural relationships

5.5. Abbreviations used to denote the journal names
List of journal codes used in the Main Data-Table (Table 5-2)

References for Chapter 5.

6. Main Data-Table
