Introduction	1
Chapter 1. Finite systems of linear inequalities	11
1. Basic definitions	11
2. The structure of polyhedrons	14
3. Bounded polyhedrons	17
4. A parametric representation of polyhedrons	23
5. The Farkas – Minkowski theorem on dependent inequalities	27
6. Attainability theorem for inequalities-implications of second kind	32
7. A refined formulation of the Farkas – Minkowski theorem	34
8. Conditions of compatibility of a finite system of linear inequalities	36
9. The cleaning theorem	40
10. Separability of nonintersecting polyhedrons	40
11. The Fourier elimination method	43
Chapter 2. Linear programming	47
12. Setting of the problem of linear programming and some its properties	47
13. Economic interpretation of the linear programming problem	49
14. Duality: informative approach	52
14.1. The two-person game with zero sum	53
14.2. The model “Production – Market”	54
14.3. The play approach to duality	55
14.4. The approach to duality where x and u in the Lagrange function are renamed	56

14.5. Duality which follows from the analysis of the Farkas – Minkowski theorem	58
14.6. Construction of the dual problem on the basis of thermo- dynamical axiomatics	59
15. The duality theorem	60
16. The optimality conditions	64
17. Informative interpretation of optimality conditions	67
18. Matrix plays and duality	68
19. The theorem on marginal values	72
20. The method of exact penalty functions in linear programming . . .	74
21. <i>LP</i> problems with several criterion functions	78
21.1. The Pareto optimization model	79
21.2. The model of lexicographic (successive) optimization . . .	82
Chapter 3. Inconsistent problems of linear programming	87
22. Classification of improper problems of linear programming (IP <i>LP</i>)	87
23. Informative interpretation of improper problems of linear program- ming	90
24. Methods of correction of improper problems of linear programming: general approaches	94
24.1. Correction of an improper problem of linear programming by its informative component	95
24.2. Other methods of optimal correction	97
25. Duality: the main theorem	99
25.1. The scheme of forming a pair of mutually dual problems C and $C^\#$ corresponding to the case of an improper problem L	99
25.2. Main theorem	102
25.3. Corollaries from the main theorem	109
26. Special realizations of duality	110
27. The duality theorem for l -problems	114
Chapter 4. Problems of successive linear programming and duality	117
28. The scheme of duality formation in linear successive programming	119
29. Solvability conditions for lexicographic optimization problems . . .	121
30. The duality theorem	124

31. Reduction of lexicographic optimization problems to systems of linear inequalities	125
31.1. A scheme of reduction for the two-step optimization problem	126
31.2. General theorem on reducibility	127
32. Lexicographic duality for improper LP problems—a special case .	127
33. Duality for improper LP problems in lexicographic interpretation .	130
34. Symmetric duality for the Pareto optimization problem	134

Chapter 5. Stability and well-posedness of linear programming problems 137

35. Necessary definitions and auxiliary results	137
36. Stability of the linear programming problem	147
37. Well-posedness of linear programming problems	151
38. The Tikhonov regularization of linear programming problems . . .	152
38.1. Geometric sense of the Tikhonov regularization	153
38.2. An auxiliary lemma	154
38.3. Tikhonov regularization of improper linear programming problems	155
38.4. Stable unsolvability of LP problems	157
38.5. Conjunction of the Tikhonov regularization methods and square penalty functions	159

Chapter 6. Methods of projection in linear programming 167

39. Fejer mappings and their properties	167
40. Basic constructions of Fejer mappings for algebraic polyhedrons .	171
40.1. Special constructions of Fejer mappings	172
40.2. General realizations	174
40.3. The convergence theorem	175
40.4. Convergence rate of Fejer processes	175
41. Decomposition and parallelizing of Fejer processes	177
42. Randomization of Fejer processes	183
43. Fejer processes and inconsistent systems of linear inequalities . . .	186
43.1. Nonexpanding M -Fejer mappings	186
43.2. The Fejer process for the problem of square approximation of an incompatible system of linear inequalities	190
43.3. Extension of the results to the case of system (43.7) with additional condition $x \in S$	191

44. Fejer processes for regularized LP problems	192
44.1. The case when the problem L is solvable	192
44.2. The case when the problem L is unsolvable	194
44.3. Dual regularization of LP problems	195
Chapter 7. Piecewise linear functions and problems of disjunctive programming	197
45. Introductory considerations	197
46. σ -extensions of linear functional spaces	199
47. The problem on the saddle point of the disjunctive Lagrange function	203
48. Piecewise linear functions and systems of piecewise linear inequalities	209
49. The problem of piecewise linear programming	212
49.1. Preliminary remarks	212
49.2. Solvability conditions for the k -problem	213
49.3. Duality	214
49.4. Symmetric setting of the problems (49.1) and (49.6) that are in the relation of duality	218
50. Duality for improper problems of piecewise linear programming . .	220
51. The method of exact penalty functions for the problem of piecewise linear programming	223
52. Questions of polyhedral separability	225
Appendix. Elements of convex analysis and convex programming	229
A1. Convex sets and convex functions	229
A2. Subdifferentiability of convex functions	231
A3. <i>The problem of convex programming</i>	232
A4. The theorem on marginal values	234
A5. The penalty function method for problems of nonlinear programming	236
A6. An estimate of deviation with respect to the argument in the asymptotic penalty method	237
Notations and abbreviations	239
Bibliography	241
