

Table of contents

1 Introduction	1
2 State of the art	3
2.1 Existing methods for roll bonding simulations.....	3
2.1.1 Assumption of the firm bond.....	3
2.1.2 Coulomb friction law	4
2.1.3 Cohesive zone model	6
2.1.4 Abaqus user-subroutine UINTER.....	8
2.1.5 Summary of the existing methods for roll bonding simulations	9
2.2 Constitutive models of mechanical and thermal interaction in the basic FE framework for simulations of hot roll bonding	10
2.2.1 Models of general mechanical interaction.....	10
2.2.2 Models of general thermal interaction	12
2.2.3 Bond strength model: bond formation	13
2.2.4 Bond strength model: bond failure (de-bonding).....	17
2.3 Isothermal process model for hot roll bonding.....	19
3 Problem definition and objectives	22
4 Truncated-cone experiments and the semi-empirical bond strength model	25
4.1 Material properties of the aluminium alloy AA6xxx and AA8xxx	25
4.2 Truncated-cone experiments to determine the bond strengths and the effects of influencing factors of multi-pass hot roll bonding.....	26
4.2.1 Experimental setup	26
4.2.2 Compression-tension and compression-torsion mode to characterize the tensile and shear bond strength	28
4.2.3 Compression-cooling-tension mode to examine the effect of temperature reduction	30
4.2.4 Compression-holding-tension mode to examine the effect of inter-pass time (diffusion)	30
4.2.5 Multiple compressions-tension mode to examine the effect of multiple consecutive height reductions	31
4.3 The Semi-empirical bond strength model for AA6xxx/AA8xxx: bond formation	32
4.3.1 Original tensile bond strength model: basic form.....	32
4.3.2 Supplement of the basic model: the influence of temperature reduction	36
4.3.3 Supplement of the basic model: the influence of inter-pass time (diffusion).....	37

4.3.4 Supplement of the basic model: the influence of multiple consecutive height reductions.....	38
4.3.5 Adaption of the original tensile bond strength model for macroscopic simulations.....	40
4.4 Semi-empirical bond strength model for AA6xxx/AA8xxx: bond failure	44
4.4.1 Stress state dependency	44
4.4.2 Behaviours of the bond under general stress states	46
5 Setup of FE models.....	48
5.1 FE models for simulations of the truncated-cone experiments	48
5.2 Coupled mechanical-thermal process model for the simulations of the multi-pass hot roll bonding	50
6 Extension of the basic FE framework to implement the adapted semi-empirical bond strength model in FE simulations.....	54
6.1 Information flow between Abaqus and the subroutine UINTER.....	54
6.2 Information flow inside the subroutine UINTER.....	54
6.3 Adapted constitutive models of general mechanical and thermal interaction	56
6.4 Coupling between the subroutine UHARD and UINTER.....	58
6.4.1 Information flow for the coupled subroutine UHARD-UIINTER for the extended FE framework.....	58
6.4.2 Mapping of the flow stress for the 2D model of the truncated-cone experiment	59
6.4.3 Mapping of the flow stress for the 3D model of the truncated-cone experiment	63
6.4.4 Mapping of the flow stress for the 2D process model of the multi-pass hot roll bonding	67
6.5 Implementation of the adapted semi-empirical bond strength model into the coupled subroutine UHARD-UIINTER	70
6.5.1 Implementation of the adapted basic model for the tensile bond strength.....	70
6.5.2 Implementation of the supplements of the basic model.....	72
6.5.3 Implementation of the bond strength under general stress states	73
7 Simulations of the truncated-cone experiments.....	76
7.1 Compression-tension mode	76
7.2 Compression-cooling-tension mode	79
7.3 Multiple compressions-tension mode.....	81
7.4 Compression-holding-tension mode	83

7.5 Compression-torsion mode 85

7.5.1 Evaluation of the 3D model by simulating the compression-tension mode 86

7.5.2 Evaluation of the 3D model by simulating the compression-cooling-tension mode 87

7.5.3 Comparison of the de-bonding torque between experiments and simulations 87

8 Multi-pass hot roll bonding experiments and simulations 91

8.1 General description of the process parameters and the applied models 91

8.2 Comparison between the experimental and simulated rolling forces 93

8.3 Distribution of the equivalent strain in thickness direction 94

8.4 Evolution of the temperature during multi-pass hot roll bonding 96

8.5 Evolution of the bond strength during multi-pass hot roll bonding 97

8.6 Bonding status after each roll bonding pass 99

8.7 Flow stress difference and relative sliding at the interface 101

9 Simulative studies with the process model of the multi-pass hot roll bonding 104

9.1 Simulative studies on the thickness ratio and the rolling schedule 104

9.2 Simulative studies on the artificially weakened bond and the reversing roll bonding 107

9.3 Simulative studies on the strength of the initial welding 108

9.4 Simulative studies on the start-rolling temperature of the multi-pass hot roll bonding 111

9.5 Interactive influences of the welding strength and start-rolling temperature on the success of the hot roll bonding passes 112

10 Summary and outlook 114
