

Contents

1. Introduction	1
1. Scattering Experiments with Three-Particle Breakup	2
2. Difficulties of the Theory	6
3. Importance of the Three-Body Problem in Nuclear Physics	10
2. Some Concepts of Quantum Mechanics	14
1. The Two-Particle Problem	14
1.1. The Hamiltonian	14
1.2. Boundary Condition of the Scattering State	15
1.3. The Møller Operator	16
1.4. Resolvent Equation and Lippmann-Schwinger Equation	19
1.5. The S-Matrix	25
1.6. The T-Matrix	28
1.7. The Unitarity Relation	30
2. The Three-Particle Problem	32
2.1. The Hamiltonian	32
2.2. Two-Particle Subsystems in Three-Particle Space	34
2.3. Boundary Conditions and Møller Operators	36
2.4. Resolvent Equation and Lippmann-Schwinger Equation	39
3. The Faddeev Equations	43
1. The Faddeev Equations for the T-Matrix	43
2. The Faddeev Equations for the Resolvent	51
3. The Faddeev Equations for the Scattering States	52
4. The S-Matrix	54
5. The Faddeev Equations for Transition Operators	58
6. The Unitarity Relation	65
4. Solution Methods for the Faddeev Equations	69
1. Partial Wave Decomposition of the Faddeev Equations	69
2. Some Concepts of the Theory of Integral Equations	74
3. Application to the Faddeev Equations	79

5. Separable Potentials	81
1. Separable Potentials in the Two-Particle Problem	81
2. Solution of the Faddeev Equations for Separable Potentials	88
2.1. Rearrangement Scattering	89
2.2. Three-Particle Breakup	91
2.3. Identical Particles	93
2.4. Numerical Solution of the Faddeev Equations for Separable Potentials	98
2.5. Results for Three Identical Particles	107
2.6. The Watson Model	112
2.7. Results for the Three-Nucleon System	115
 6. Solution of the Faddeev Equations for Local Potential	 122
1. Direct Solution of the Faddeev Equations for Local Potential	122
2. The Schmidt Method (Weinberg's Quasiparticle Method)	126
3. The Quasiparticle Method in the Three-Particle Problem	133
3.1. The Alt-Grassberger-Sandhas Equations	133
3.2. Application of the Quasiparticle Method to the Three-Particle Resolvent Equation	136
3.3. Practical Calculations with the Quasiparticle Method	151
 7. Solution of the Faddeev Equations by Padé Approximation	 156
1. The Technique of Padé Approximation	156
2. Padé Approximation and Integral Equations	158
3. Padé Approximation and the Faddeev Equations	159
 8. Variational Methods	 163
1. Variational Methods for Bound States	163
2. Variational Methods for Elastic Scattering and for Multichannel Scattering	168
3. Variational Methods for Multichannel Scattering with Three-Particle Breakup	179
3.1. Hyperspherical Functions	183
3.2. Sequential Decay States	192
3.3. The Method of Pieper, Schlessinger, and Wright	197
