0 General	9	2.3.3	Fracture mechanics quantities for static loading 29
0.1 Objectives and areas of application	9	2.3.3.1	Quantities 29
0.2 Reference documents	9	2.3.3.2	Influence factors 31
0.3 Problem definition and approach	9	2.3.3.3	Experimental determination 32
0.4 Summary, working steps	11	2.3.4	Fracture mechanics quantities for cyclic loading 32
1 Principles and concept	15	2.3.4.1	Quantities 32
1.0 Overview, general	15	2.3.4.2	Influence factors 34
1.1 Effects of defects on the component strength	16	2.3.4.3	Experimental determination 35
1.2 Fracture mechanics concepts	16	2.3.5	Scatter of material properties 35
1.2.1 Limiting states	16	3 Modelling	37
1.2.2 Static loading	17	3.0 Overview, working steps	37
1.2.3 Cyclic loading	18	3.1 Crack model	38
1.2.4 Linear-elastic fracture mechanics	18	3.1.1 General	38
1.2.5 Elastic-plastic fracture mechanics	18	3.1.2 Transfer of NDE indications into defect dimensions	38
1.2.6 Assessment diagrams	19	3.1.3 Defect orientation	40
1.3 Defect assessment concept of this guideline	20	3.1.4 Defect shape	41
2 Input quantities	21	3.1.5 Interactions of defects	42
2.0 Overview, working steps	21	3.2 Structural model	45
2.1 Defect state	22	3.2.1 General	45
2.1.1 General	22	3.2.2 Simplification of geometry	45
2.1.2 Defect description	23	3.2.3 Simplification of loading	46
2.1.3 Defect detection and sizing	23	3.3 Loading parameters	48
2.1.3.1 Non destructive testing procedures	23	3.3.1 General	48
2.1.3.2 Defect detectability	23	3.3.2 Stress intensity factor (SIF)	48
2.1.3.3 Testing standards	24	3.3.2.1 Definition and application	48
2.1.3.4 Production quality	24	3.3.2.2 Calculation of SIF	48
2.2 Loading state	25	3.3.3 Loading parameters J and δ	49
2.2.1 General	25	3.3.4 FAD parameter K_r	49
2.2.2 Static loading	25	3.3.4.1 Definition and application	49
2.2.3 Cyclic loading	25	3.3.4.2 Calculation of K_r	49
2.2.3.1 Constant amplitude	25	3.3.5 Plasticity Parameter L_r	50
2.2.3.2 Variable amplitude	26	3.3.5.1 Definition and application	50
2.2.3.3 Consideration of residual stresses	27	3.3.5.2 Calculation of L_r	50
2.3 Material state	28	3.4 Material model	51
2.3.1 General	28	3.4.1 General	51
2.3.2 Tensile test material properties	28	3.4.2 Tensile material values	52
2.3.2.1 Characteristic quantities	28	3.4.3 Fracture mechanics material values for static loading	54
2.3.2.2 Influence factors	28	3.4.3.1 Direct determination from test values	54
2.3.2.3 Experimental determination	29	3.4.3.2 Estimation by correlations	55
		3.4.3.3 Other ways to estimate fracture toughness	56
		3.4.4 Fracture mechanics materials values for cyclic loading	57

4	Calculations	59	7.2.1	Pre-considerations	117
4.0	Overview, working steps	59	7.2.2	Reference fracture toughness from test data at a single temperature	117
4.1	Calculation scheme for static loading	60	7.2.3	Reference fracture toughness from test data over a range of temperatures	118
4.1.1	General	60	7.2.4	Evaluation of fracture toughness K_{mat}	119
4.1.2	FAD concept	60	7.3	Material data	120
4.1.2.1	Determination of failure conditions for limit state crack initiation	61	7.3.1	Standard values	120
4.1.2.2	Determination of failure conditions for limit state crack instability	61	7.3.2	Fracture mechanics material data for static loading	131
4.1.2.3	Quality of input data	61	7.3.3	Fracture mechanics material data for cyclic loading	148
4.1.3	Failure lines	62	7.3.3.1	Recommendations from other guidelines	148
4.1.3.1	General	62	7.3.3.2	Evaluation of published data	150
4.1.3.2	Basic level	62	7.4	Stress intensity factors and limit loads	180
4.1.3.3	Extension level	63	7.4.1	Round bar	182
4.1.4	Determination of FAD parameter K_r	63	7.4.2	Plate	185
4.1.4.1	Determination of plasticity correction p	63	7.4.2.1	Constant stress	185
4.1.4.2	Determination of plastically corrected SIF K_{s^p}	64	7.4.2.2	Variable stress	191
4.2	Calculation scheme for cyclic loading	64	7.4.3	Plate with hole	196
4.2.1	General	64	7.4.4	Welded joint	202
4.2.2	Integration of crack growth rate	64	7.4.4.1	Weld toe	202
4.2.3	Estimation of crack growth without fracture mechanics software	65	7.4.4.2	Weld joint with strength mismatch	207
4.3	Fracture mechanics software	66	7.4.5	Hollow cylinder	215
5	Assessment (Proof of Strength)	67	7.4.5.1	Axial cracks, variable stresses	215
5.0	Overview, working steps	67	7.4.5.2	Circumferential cracks, variable stresses	222
5.1	Reserve factors	68	7.4.5.3	Axial cracks, internal pressure	232
5.2	Sensitivity analyses	68	7.4.5.4	Circumferential cracks, internal pressure and bending	236
5.3	Partial safety factors	69	7.5	Residual stresses	243
5.3	Acceptability assessment	70	7.5.1	General	243
6	Worked examples	71	7.5.2	Simple estimation of residual stresses	243
6.0	General	71	7.5.3	Recommended stress profiles	243
6.1	Shaft	72	7.5.3.1	General	243
6.2	Welded plate	74	7.5.3.2	Plate with butt weld or tube with axial seam	243
6.3	Flywheel	78	7.5.3.3	Pipe with circumferential butt weld	244
6.4	Welded offshore tube node	81	7.5.4.4	Tubular and pipe to plate joints	244
6.5	Box profile	85	7.6	Strength mismatch in welded joints	245
6.6	Thin-walled welded structure	89	7.6.1	General remarks to the mismatch problem	245
6.7	Spiral welded pipe	93	7.6.2	Fracture mechanics treatment	245
6.8	Generator shaft	97	7.6.3	Modified failure lines for static loading	246
6.9	Valve housing with casting defects	101	7.6.3.1	General	246
6.10	Welded aluminium container	107	7.6.3.2	Basic level	247
6.11	Turbine shaft	111	7.6.3.3	Extension level	249
			7.6.3.4	Further aspects of the assessment of mismatch joints	249
7	Annexes	115	7.7	Symbols, abbreviations, conversions	251
7.0	General	115			
7.1	Standards and guidelines for non destructive examination	115			
7.2	Evaluation of fracture toughness tests in the transition regime	117
