

Contents

Notations	IV
1 System Theoretical Background	1
1.1 Introduction	1
1.2 Some representation and properties of linear multivariable systems	3
1.3 Stability of multivariable feedback systems	20
1.4 Design of time-discrete multivariable feedback systems	23
1.5 References	30
2 Design of Linear Time-Invariant Feedback Systems with Minimized Comparison Sensitivity Function	32
2.1 Introduction	32
2.2 Linear multivariable feedback systems with dynamic state regulator	39
2.2.1 Structure of the feedback system	40
2.2.2 General requirements	42
2.2.3 Interrelations between plant parameters and controller parameters	42
2.2.4 Design relationships in a canonical form for the plant	43
2.2.5 Canonical form for the controller	47
2.2.6 Free parameters for the controller design	49
2.2.7 Structure in the z -domain	50
2.2.7.1 Command behavior	50
2.2.7.2 Disturbance behavior and sensitivity	51
2.2.7.3 General disturbances	53
2.2.7.4 Input disturbances	54
2.2.7.5 Output disturbances	55
2.2.8 Sensitivity	56
2.2.9 Significance of the plant zeros	57
2.3 Requirements regarding sensitivity behavior and disturbance behavior	58
2.3.1 Sensitivity function	59
2.3.1.1 Case $p = r$	59
2.3.1.2 Case $p > r$	60
2.3.1.3 Case $p < r$	64

2.3.2	Disturbance transfer function	64
2.4	Special representations of the controller transfer functions	66
2.4.1	Preparation of $Z_G(z)$ for the sensitivity design	67
2.4.2	Preparation of $r_G(z)$ for the sensitivity design	78
2.5	Determination of the free parameters	81
2.5.1	Zeros for the sensitivity function	82
2.5.2	Minimization of the sensitivity function	85
2.5.3	Minimization of the sensitivity function with secondary condition in accordance with 2.5.1	88
2.6	Summary of the controller design	90
2.7	Example	93
2.7.1	2 x 3rd order controllers	102
2.7.2	2 x 4th order controllers	106
2.8	References	112
3	Robust Design of Multimodel Feedback Systems	114
3.1	Pole-distance-design	114
3.1.1	Introduction	114
3.1.2	Definition of the pole-distance	114
3.1.3	Pole-distance as assignment-problem	116
3.1.4	Continuity of the pole-distance	117
3.1.5	The pole-distance as a function of the controller-parameters	119
3.1.6	Recursive controller design	122
3.1.7	Sequence of the inputs	124
3.1.8	Minimizing the pole-distance	124
3.1.9	Example	125
3.1.10	Sensor- and actuator - failure	134
3.2	Input-method	139
3.2.1	Introduction	139
3.2.2	Finding a controller with a preassigned pole and a preassigned zero	140
3.2.3	More than one variation cases	142
3.2.4	More than one controller-inputs	143
3.2.5	Slowly varying input - and output - variables	144

VIII

3.2.6 Adapting the controller to step-wise varying sampling-time	146
3.3 Robust stability	148
3.3.1 Introduction	148
3.3.2 Multiplicative perturbations	149
3.3.3 Additiv perturbations	153
3.3.4 Multi-model-case, transition stability	155
3.3.5 Example	158
3.3.6 Gamma-stability	160
3.4 References	163
Index	164
