

Contents

G. Csaba

Why do hormone receptors arise? An introduction	7
The evolution of recognition	7
Signal receivers and signal molecules	8
Interrelation of hormone receptor evolution	9
Conclusions	11

M.D. Hollenberg

Mechanisms of receptor-mediated transmembrane signalling	15
Receptors, acceptors channels and the problem of transmembrane- signalling	15
General mechanisms of transmembrane signalling	16
Receptor dynamics and transmembrane signalling	19
Receptor microclustering and cell activation	22
Internalized receptor and cell activation	25
Summary	27

E. van Obberghen and S. Gammeltoft

Insulin receptors: structure and function	31
Introduction	31
The molecular mechanism of insulin action	31
The insulin receptor kinase	32
Biochemical properties of the insulin receptor kinase	35
Role of receptor phosphorylation in insulin action	36
Structure-function relationship of the insulin receptor kinase	40
Summary and conclusions	41

J.-L. Carpentier, P. Gorden, A. Robert and L. Orci

Internalization of polypeptide hormones and receptor recycling	47
Introduction	47
Historical perspective	47
Events at the cell surface (steps 1, 2 and 3)	49
Initial steps of endocytosis (steps 4 and 5)	52
Later steps of endocytosis (steps 6, 7 and 8)	52
Receptor recycling	55
What determines the specificity of receptor-mediated endocytosis ...	56
Biochemical features of receptor-mediated endocytosis	58
Functional implications of receptor-mediated endocytosis	58
Conclusions	60

J. Gorski

The nature and development of steroid hormone receptors	67
Models of steroid hormone action	67
Nuclear binding sites	71
Development of steroid receptors: Ontogeny of estrogen receptors ..	73

<i>G. Csaba</i>	
Receptor ontogeny and hormonal imprinting	79
Receptor alterations during ontogenetic development	80
Why is receptor adaptation necessary? An approach based on information theory	81
Experimental evidence for hormonal imprinting	83
Polypeptide hormones	83
Imprinting by related hormones; the disturbing effect of 'noise'	84
Overlapping imprinting by steroid hormones	86
Imprinting with acid type hormones	88
The importance and sensitivity of imprinting	89
Hormonal imprinting in cell lines	91
Cell-cell transmission of hormonal imprinting	92
Hormonal imprinting at enzyme level	92
The mechanism of imprinting	93
The major stages of the development of encoded adaptation-requiring dynamic systems in mammals	95
Medicinal aspects of hormonal imprinting	98
 <i>K.D. Döhler</i>	
The spectral case of hormonal imprinting, the neonatal influence of sex	103
Historical perspectives	103
Environmental influences on sexual differentiation	103
Genetic influences on sexual differentiation	104
Hormonal influences on sexual differentiation	104
1. Differentiation of the gonads	104
2. Differentiation of reproductive tract and external genitalia	104
3. Differentiation of the brain	105
Conclusions	117
 <i>P. Kovacs</i>	
The mechanism of receptor development as implied by hormonal imprinting studies on unicellular organisms	125
The role of the cell membrane in hormonal imprinting	127
The role of second messengers in hormonal imprinting	127
Impact of the inhibition of endocytosis, transcription and translation on hormonal imprinting	128
Impact of hormone concentration and time factor on hormonal imprinting	129
Which materials can induce imprinting	129
Study of induced receptors in the <i>Tetrahymena</i>	130
Receptor 'memory' in unicellular model systems	130
Structural studies on membrane receptors of <i>Tetrahymena</i>	132
Specificity of the hormone receptors of <i>Tetrahymena</i>	132
 <i>E.J.W. Barrington</i>	
The phylogeny of the endocrine system	137
The scope of phylogeny	137
Thyroidal phylogenesis	138

The steroid ring system.....	139
Peptide hormones	140
Pathways of endocrine diversification.....	141
Multiple sites and actions.....	143
Invertebrates	144
Challenging perspectives.....	146
<i>G. Csaba</i>	
A new approach to the molecular evolution of hormones: the receptorial aspect	149
The signal molecule potential of amino acids.....	149
The signal molecule potential of oligopeptides	152
<i>D. Bückmann</i>	
Common origin and phylogenetic diversification of animal hormonal systems	155
The significance of the evolutionary history of hormones	155
The approach of comparative physiology.....	156
The common base of intercellular messenger substances in multicellular organisms	157
The different evolutions of animal and plant hormonal systems	158
Diversification of hormonal systems in multicellular animals	158
The evolutionary history of neurosecretion	159
Neuroendocrine and epithelial endocrine glands.....	160
Under what conditions do complicated hormonal systems evolve?...	160
Hormonal control of sexual differentiation	161
The evolution of endocrine organs from the target tissue.....	161
The principle of polytropic action	162
Summary	164
<i>D. LeRoith, C. Roberts Jr, M.A. Lesniak and J. Roth</i>	
Receptors for intercellular messenger molecules in microbes: similarities to vertebrate receptors and possible implications for diseases in man ...	167
Introduction.....	167
Unicellular eukaryotes	169
Prokaryotes	176
Conclusion.....	177
<i>K.D. Döhler</i>	
Development of hormone receptors: Conclusions.....	181
Vertebrate hormones exist in invertebrates, in unicellular organisms and in plants	181
Lower organisms possess receptors for vertebrate hormones.....	182
Evolutionary aspects of hormones and receptors	183
The genetic code for receptor synthesis.....	185
Hormone-induced activation of receptor synthesis	186
Hormone-induced organization of receptors	187
A teleological point of view	189
INDEX.....	193
