
Contents

1	Multiphase Continua, an Introduction	1
2	Elementary Notation and Mathematical Operations	5
2.1	Vectors, Products and Norms	5
2.2	Basic Linear Algebra	6
2.3	Integral Transformations	10
3	Governing Electromagnetics: Maxwell's Equations	13
3.1	Coulomb Forces	13
3.2	Electric Field	14
3.3	Electric Flux	15
3.4	Current Density and Conductors	17
3.5	Work and Voltage	18
3.6	Maxwell–Ampere Law and the Magnetic Field	19
3.7	Faraday's Induction Law	21
3.8	Constitutive Relations	24
3.9	Localization: Point-Forms of Maxwell's Equations	28
3.10	Remark on Conservation Laws	30
3.11	Explicit Representations	30
3.12	Interface Conditions	31
3.12.1	The Electric Field Intensity	31
3.12.2	Electric Flux Density	32
3.12.3	The Magnetic Field Intensity	33
3.12.4	Magnetic Flux	33
3.12.5	Summary	34
3.13	Physical Interpretation of Operators	34
3.14	“Hidden” Maxwellian Waves	35

4	Classical Linear Constitutive Behavior	39
4.1	Linear Constitutive Equations	39
4.1.1	Material Symmetry	40
5	Extraction of Macroscopic Effective Properties	45
5.1	Effective Properties of Heterogeneous Electromagnetic Media	45
5.1.1	Framing and the Construction of a Boundary Value Problem	46
5.1.2	Computational Testing	47
5.2	Averaging Theorems	50
5.2.1	The Average Electric Field Theorem	50
5.2.2	The Average Electric Field Flux Theorem	51
5.3	Effective Property Estimates	51
5.3.1	The Hill–Reuss–Voigt–Wiener Bounds	51
5.3.2	Isotropic Cases	53
5.3.3	The Asymptotic Hashin–Shtrikman Bounds	53
5.4	Phase Concentration and Load-Sharing	54
5.4.1	“Load Sharing” Interpretation	58
5.5	Current-Fields	58
5.5.1	Remark: Averaging Theorems	61
5.6	Remarks	61
5.6.1	The Average Current Theorem	61
5.6.2	Special Cases of Maxwell’s Equations	62
6	Coupled Effects: Joule-Heating	63
6.1	Introduction	63
6.2	The Joule-Fields	64
6.2.1	Ergodic Assumptions for the Joule-Field	64
6.2.2	Decomposition of the Joule-Field	64
6.3	Limits on Fields	65
6.4	Utilization of Effective Property Bounds	66
6.5	Asymptotic Limits: Superconductors and Insulators	68
6.5.1	Case 1: High-Conductivity (“Superconducting”) Particles	68
6.5.2	Case 2: Low-Conductivity (“Insulator”) Particles	69
6.6	Coated and Multiphase Materials	70
6.7	Summary and Discussion	72
7	Some Basic Principles of Continuum Mechanics	73
7.1	Motion and Deformation	73
7.2	Deformation of Line Elements	74
7.3	The Jacobian of the Deformation Gradient	75
7.4	Equilibrium/Kinetics of Solid Continua	75
7.5	Postulates on Volume and Surface Quantities	76
7.6	Balance Law Formulations	77

7.7	Symmetry of the Stress Tensor	78
7.8	The First Law of Thermodynamics – An Energy Balance	78
7.9	Special Case: Electromagnetic Thermocoupled Problems.....	79
7.10	The Poynting Vector	80
7.11	Infinitesimal Linearly Elastic Constitutive Laws	81
7.11.1	Infinitesimal Strain Linear Elasticity	81
7.11.2	Material Symmetry	82
7.11.3	Material Constant Interpretation	87
8	Basic Time-Stepping Schemes	89
8.1	Hybrid Methods.....	91
8.2	Coupled Problems and Staggering Schemes	93
8.3	Temporally-Adaptive Iterative Methods	95
8.4	Temporally Second Order Equations	97
8.5	Spatial Discretization: Spatial Finite Difference Stencils	99
9	A Model Problem: Dielectrics Undergoing Multifield Processes	103
9.1	Introduction	103
9.1.1	Thermal Coupling	103
9.1.2	Numerical Methods	105
9.2	Transient Electro-Magneto-Thermo Coupled Fields	107
9.2.1	Electromagnetic Fields: Maxwell's Equations.....	107
9.2.2	Thermodynamics: First Law and Absorption of Energy	107
9.3	Numerical Simulations: Staggering Schemes	109
9.3.1	Spatial Discretization of the Coupled System	110
9.3.2	Temporal Discretization of the Coupled System	112
9.3.3	The Overall Solution Scheme	114
9.3.4	Discussion of the Numerical Scheme	116
9.4	Mesoscale Computations	118
9.4.1	Sample Size Selection	118
9.4.2	A Model Problem	119
9.4.3	System Parameters	120
9.4.4	Numerical Results	122
9.4.5	Observations.....	123
9.5	Stress- and Chemically-Induced Damage.....	125
9.5.1	Damage Evolution	130
9.5.2	Modification of the First Law of Thermodynamics	131
9.5.3	Solid-State Diffusion-Reaction	132
9.5.4	Discretization of the Mechanical and Concentration Fields.....	133
9.5.5	Extended Numerics: Staggering for Electro-Magneto-Thermo-Mechano-Chemo Systems.....	134
9.6	Summary.....	136

9.7	An Electro-Magneto-Thermo-Mechano-Chemo Numerical Example	137
9.8	Thermoelectricity and More Coupling	138
9.8.1	Temporal Discretization of the Coupled System	141
9.9	Electrically-Aided Sintering	142
9.10	Inverse Problems and Material Design	144
9.10.1	Remarks on Nonconvex Optimization	146
9.10.2	Database Approaches	149
10	Concluding Remarks and Emerging Applications in the Biological Sciences	151
10.1	Objectives	152
10.2	Laboratory Experiments	153
10.3	Theoretical Estimates: Extraction of Cell Data from Cell-in-Solution	154
10.3.1	Effective Permittivity Estimates	155
10.3.2	Interpreting the Measurements	156
10.3.3	Observations	158
10.4	Computational Simulation of Multiple Cell Samples	158
10.4.1	Outline of the Approach	158
10.4.2	Computational Effective Property Calculation	159
10.4.3	Numerical Discretization of Maxwell's Equations	161
10.4.4	A Model Problem	163
10.5	Discussion and Concluding Remarks	166
11	References	167
