**Author biography — V**

**Preface — VII**

**Acknowledgments — IX**

## **Chapter 1**

### **Wireless communication overview — 1**

- 1.1 History of wireless communications — 1
  - 1.1.1 Wireless communication in preindustrial period — 1
  - 1.1.2 First radio transmission demonstration — 2
  - 1.1.3 Wireless voice transmission and the cellular systems — 2
  - 1.1.4 Packet radio — 3
  - 1.1.5 Radio paging — 4
  - 1.1.6 Satellite communications — 5
- 1.2 Technical challenges of wireless communications — 6
  - 1.2.1 Signal propagation characteristics and fading effects — 6
  - 1.2.2 Spectrum regulations and limitations — 8
  - 1.2.3 Energy constrains — 11
  - 1.2.4 User mobility constrains — 12
  - 1.2.5 Cross-layer design — 13
- 1.3 Wireless systems and standards — 13
  - 1.3.1 Cellular telephone systems — 13
  - 1.3.2 Wireless local area networks — 21
  - 1.3.3 Codeless phones — 24
  - 1.3.4 Satellite networks — 29
  - 1.3.5 Short-range wireless communication technology: Bluetooth, ZigBee, RFID and Ultra-Wideband Radios — 30
- Problems — 35

## **Chapter 2**

### **Wireless propagation channel modeling: large-scale path loss and shadowing — 37**

- 2.1 Radio wave propagation and frequency band for radio communications — 37
  - 2.1.1 Introduction to radio wave propagation — 37
  - 2.1.2 Frequency band for radio communications — 38
  - 2.1.3 Doppler frequency shift — 39
  - 2.1.4 Equivalent low-pass representation of passband signals — 40
- 2.2 Free space propagation model — 40

2.3	Ray tracing mechanisms and models —	<b>43</b>
2.3.1	Reflection —	<b>44</b>
2.3.2	Diffraction —	<b>45</b>
2.3.3	Scattering —	<b>47</b>
2.3.4	General ray tracing model —	<b>48</b>
2.3.5	Ground reflection two-ray model —	<b>48</b>
2.4	Empirical outdoor path loss models —	<b>50</b>
2.4.1	Okumura path loss model —	<b>51</b>
2.4.2	Hata model —	<b>51</b>
2.4.3	Extension to Hata model —	<b>52</b>
2.5	Indoor path loss models —	<b>53</b>
2.5.1	Partition losses in the same floor —	<b>53</b>
2.5.2	Partition losses between floors —	<b>54</b>
2.5.3	Indoor attenuation loss model —	<b>54</b>
2.6	Log-distance path loss model —	<b>54</b>
2.7	Log-normal shadowing —	<b>55</b>
2.8	Link budget —	<b>56</b>
2.8.1	Calculation of the noise power —	<b>56</b>
2.8.2	Link budget calculation —	<b>57</b>
	Problems —	<b>58</b>

### **Chapter 3**

#### **Wireless propagation channel modeling: small-scale fading and statistical multipath channel — 61**

3.1	Factors influencing small-scale fading —	<b>61</b>
3.1.1	Multipath propagation and the signal bandwidth —	<b>61</b>
3.1.2	Relative motion of the receiver, transmitter and/or surrounding objects —	<b>62</b>
3.2	Channel impulse response model —	<b>62</b>
3.3	Small-scale fading mechanism and channel classification —	<b>66</b>
3.3.1	Time delay spreading of a channel —	<b>67</b>
3.3.2	Channel coherence bandwidth —	<b>68</b>
3.3.3	Flat fading channel —	<b>70</b>
3.3.4	Frequency-selective fading channel —	<b>70</b>
3.3.5	Doppler spread and channel coherence time —	<b>71</b>
3.3.6	Slow fading channel —	<b>72</b>
3.3.7	Fast fading channel —	<b>72</b>
3.4	Performance degradations viewed in different domain —	<b>73</b>
3.4.1	Small-scale fading mechanisms in quasi-duality view —	<b>73</b>
3.4.2	Performance degradations due to time spreading viewed in time delay domain —	<b>73</b>

- 3.4.3 Performance degradation due to time spreading viewed in the frequency domain — **75**
- 3.4.4 Performance degradation due to time variance viewed in the time domain — **76**
- 3.4.5 Performance degradation due to time variance viewed in the Doppler shift domain — **76**
- 3.5 Envelop distributions of fading channels — **78**
  - 3.5.1 Rayleigh fading channel — **78**
  - 3.5.2 Ricean fading channel — **79**
  - 3.5.3 Nakagami fading channel — **80**
- 3.6 Level crossing rate and average fading duration — **81**
- Problems — **82**

## Chapter 4

### Digital modulations over wireless channels — **83**

- 4.1 Transmitter and receiver diagrams — **84**
- 4.2 Signal space representation — **85**
  - 4.2.1 Signal space and constellation — **85**
  - 4.2.2 Decision regions and the maximum likelihood decision criterion — **88**
- 4.3 Modulation principles and formats — **90**
  - 4.3.1 Pulse amplitude modulation (PAM) — **90**
  - 4.3.2 Multiple phase shift keying (MPSK) — **92**
  - 4.3.3 Quadrature amplitude modulation (MQAM) — **101**
  - 4.3.4 Frequency modulation — **102**
- 4.4 Pulse shaping — **104**
  - 4.4.1 Rectangular pulse — **104**
  - 4.4.2 Cosine pulses — **106**
  - 4.4.3 Raised cosine pulse — **106**
  - 4.4.4 Root cosine pulse — **106**
  - 4.4.5 Gaussian pulse — **108**
- 4.5 Performance of digital modulations over wireless channels — **109**
  - 4.5.1 Performance of digital modulations over AWGN channel — **109**
  - 4.5.2 Performance of digital modulations over wireless fading channels — **113**
  - 4.5.3 Effect of delay and frequency spread on the error probability — **117**
- Problems — **119**

## Chapter 5

### Diversity, channel coding and equalization — **121**

- 5.1 Diversity — **122**
  - 5.1.1 Different realization methods of diversity — **122**
  - 5.1.2 Combining techniques of receiver diversity — **123**
  - 5.1.3 Polarization diversity — **129**

- 5.1.4 Frequency diversity — **130**
- 5.2 Channel coding over fading channel — **130**
- 5.2.1 Fundamentals of channel coding — **131**
- 5.2.2 Block coding — **132**
- 5.2.3 Convolutional codes — **137**
- 5.2.4 Coding and interleaving for fading channels — **141**
- 5.3 Equalization — **143**
- 5.3.1 Time domain equalization — **144**
- 5.3.2 Frequency domain equalizer — **149**
- Problems — **150**

## **Chapter 6**

### **Spread spectrum systems and spread spectrum with RAKE receiver — 153**

- 6.1 Spread spectrum — **153**
- 6.1.1 Principle of spread spectrum — **153**
- 6.1.2 Characteristics of spread spectrum communications — **155**
- 6.1.3 Pseudo-random sequences in spread spectrum systems — **157**
- 6.2 Spread spectrum with RAKE receiver — **180**
- Problems — **182**

## **Chapter 7**

### **Multicarrier modulation and multi-antenna systems — 183**

- 7.1 Multicarrier modulation — **183**
- 7.1.1 Overview of multicarrier modulations — **183**
- 7.1.2 Fundamentals of OFDM — **184**
- 7.1.3 Principle of OFDM modulation and demodulation — **185**
- 7.1.4 Guard interval (GI) and cyclic prefix (CP) — **186**
- 7.1.5 Oversampling of IDFT — **188**
- 7.1.6 Structure of OFDM modulation and demodulation — **188**
- 7.1.7 Design of the parameters of OFDM — **190**
- 7.1.8 Advantages and disadvantages of OFDM — **190**
- 7.1.9 Applications of OFDM — **191**
- 7.2 Multi-antenna systems — **192**
- 7.2.1 MIMO channel model — **193**
- 7.2.2 MIMO channel capacity — **195**
- 7.2.3 Applications of MIMO — **196**
- 7.2.4 Massive MIMO — **199**
- Problems — **200**

**Chapter 8****Duplexing, multiple access and cellular design fundamentals — 203**

- 8.1 Duplexing — 203
  - 8.1.1 FDD — 203
  - 8.1.2 TDD — 204
  - 8.1.3 Combination of FDD and TDD — 205
  - 8.1.4 Full duplex (FD) — 205
- 8.2 Multiple access — 205
  - 8.2.1 Introduction to multiple access — 205
  - 8.2.2 Frequency division multiple access (FDMA) — 206
  - 8.2.3 Time division multiple access (TDMA) — 207
  - 8.2.4 Code division multiple access (CDMA) — 209
  - 8.2.5 Multiple access for packet radio (PR) — 211
- 8.3 Cellular system design fundamentals — 217
  - 8.3.1 Channel reuse principle — 217
  - 8.3.2 Handoff processing — 222
  - 8.3.3 A simplified prototype cellular system — 224
  - Problems — 230
