

Contents

Introduction	XIX
Processing stages	XIX
Logic for polymer process design	XX
a) Low thermal diffusivity	XX
b) High viscosity	XXI
c) Combined effects of low conductivity and high viscosity	XXII
d) Viscoelasticity	XXII
Plastics sales	XXIII
 Chapter 1 Continuum Mechanics – Review of Principles	 1
1.1 Strain and rate-of-strain tensor	1
1.1-1 Strain tensor	1
a) Phenomenological definitions	1
b) Displacement gradient	2
c) Rigid rotation	2
d) Deformation or strain tensor ϵ	3
e) Simple shear and symmetry of the tensor ϵ	4
f) Volume variation during deformation	5
1.1-2 Rate of strain tensor	5
1.1-3 The equation of continuity	7
a) Mass balance	7
b) Incompressible materials	8
Problems 1.1	9
1.2 Stresses and force balances	11
1.2-1 The stress tensor	11
a) Phenomenological definitions	11
b) The stress vector	11
c) The stress tensor	12
d) Isotropic stress or hydrostatic pressure	14
e) The deviatoric stress tensor	14
1.2-2 Force Balances	15
1.2-3 Torque Balances	16
Problems 1.2	17
1.3 General equations of mechanics	18
1.3-1 General case	18
1.3-2 Incompressibility	18
1.1-3 Planar flow	19
Problem 1.3	19

1.4	Viscosity – the equation of motion for Newtonian liquids	19
1.4-1	The Newtonian behaviour	20
a)	Newton's Law (1687)	20
b)	Generalization to three-dimension flows	20
c)	Simple shear flow	21
1.4-2	Order of magnitude of the various quantities	21
a)	Units of viscosity and characteristic values	21
b)	Reynolds number	22
c)	Effect of gravity	23
1.4-3	Navier-Stokes equations	23
1.4-4	Solution of the Navier-Stokes equations	24
a)	Analytical solutions	24
b)	Numerical methods	24
	Problems 1.4	27
1.5	Shear-thinning behaviour	31
1.5-1	Phenomenological description	31
1.5-2	Three-dimension models	33
1.5-3	Simple shear flow between parallel plates	33
1.5-4	Flow through a circular tube (Poiseuille flow)	34
1.5-5	Viscometric flows	36
1.5-6	Computation methods in more complex flows	39
	Chapter 2 Energy and Heat Transfer Processes	41
2.1	Basic notions on energy	41
2.1-1	Work done by deformation	41
a)	Simple flow geometries	41
b)	Generalization	42
c)	Dissipated power	42
d)	Newtonian and shear-thinning liquids	43
2.1-2	The equation of energy	43
a)	Internal energy	43
b)	Conduction	44
c)	Equation of energy	44
2.1-3	Boundary conditions	45
a)	Constant wall temperature	45
b)	Constant heat flux	46
c)	Solid-fluid interface	46
2.1-4	Solution of the heat transfer equation	48
2.2	Cooling in molds, in air and in water	49
2.2-1	Heat transfer equations	49
2.2-2	Heat penetration thickness and thermal diffusivity	50
2.2-3	Interfacial temperature and effusivity	52
2.2-4	Interfacial temperature with convection	55
2.2-5	Example: heating (or cooling) of a plate	57
a)	Isothermal boundary conditions	57
b)	Convective boundary conditions	59

2.3	Viscous dissipation	63
2.3-1	Heat generation in Poiseuille flow	64
	a) Equilibrium regime	66
	b) Adiabatic regime	67
	c) Transition regime	68
	d) Analysis of the different thermal regimes	70
	e) Application	71
2.3-2	Heat generation in Poiseuille flow - Wall temperature different from the initial polymer temperature	72
2.3-3	Heat generation in Poiseuille flow for shear-thinning fluids	75
	a) Equilibrium regime	76
	b) Transition regime	77
2.3-4	Heat generation in simple shear flow	80
	a) Equilibrium regime	80
	b) Adiabatic regime	81
	c) Transition regime	82
2.3-5	Heat generation in planar Poiseuille flow	84
	a) Equilibrium regime	84
	b) Adiabatic regime	85
	c) Transition regime	85
2.3-6	Applications to polymer processing	85
Chapter 3	Flow of Molten Polymers in Various Geometries	91
3.1	Pressure build up in polymer flow	91
3.1-1	Qualitative analysis of three flow situations	91
	a) The Rayleigh bearing	91
	b) Contact of two cylinders	92
	c) The Reynolds bearing	93
3.1-2	Pressure generated in a Rayleigh bearing	93
3.1-3	Flow in a variable gap geometry	95
	a) The lubrication approximations	95
	b) The Reynolds equations	96
	Problem 3.1	97
3.2	Calendering	98
3.2-1	General description	98
3.2-2	Symmetrical Newtonian analysis	100
	a) Spread height	101
	b) Roll separating force and torque exerted on the roll	102
3.2-3	Asymmetrical Newtonian analysis	104
3.2-4	Shear-thinning fluids	105
	a) Equation of motion	105
	b) Generalized Reynolds equation	106
3.2-5	Integrated generalized Reynolds equation	107
3.2-6	Thermal effects in calendering	109
	a) Uncoupled solution	110
	b) Coupled solution	111

3.3	Extrusion dies	115
3.3-1	Description of extrusion dies	116
	a) Sheetting die	116
	b) Tubing die	116
	c) Wire-coating die	116
	d) Film-blowing die	117
	e) Profile dies	118
3.3-2	General flow equations	118
	a) Hydrodynamic lubrication approximations	118
	b) Confined flow approximations	119
	c) Other geometrical approximations	121
	d) Average temperature approximation	121
3.3-3	Tube die	123
3.3-4	Wire-coating die	125
	a) Axi-symmetrical zone	126
	b) Distribution zone around the guider	126
3.3-5	Sheetting die	128
3.3-6	Film-blowing die	129
	Problems 3.3	132
3.4	Flow of polymers in molds	135
3.4-1	Injection molding	135
3.4-2	Isothermal Newtonian flow in a disk-shaped mold	138
	a) Postulates	138
	b) Equation of motion	139
	c) Velocity profile	139
	d) Pressure profile	140
3.4-3	Filling of a shear-thinning fluid in a disk-shaped mold	142
	a) Velocity profile	142
	b) Pressure profile	142
3.4-4	Filling of a shear-thinning temperature dependent fluid in a disk-shaped mold	144
	Problem 3.4	148
Chapter 4	Polymer Extrusion	151
4.1	General description of a single screw extruder	151
4.1-1	The different zones of an extruder	151
4.1-2	Screw characteristics	152
4.1-3	Screw geometry	153
4.1-4	Hypothesis on the rotational speed	155
4.1-5	Relative velocity of the barrel	156
4.1-6	Reference extruder	157
4.2	Feed zone of an extruder	157
4.2-1	Solid conveying in the feed zone	157
4.2-2	Metal-polymer friction	158
4.2-3	Principle of Archimedes' screw	159
4.2-4	Influence of channel depth on the solid velocity	161
4.2-5	Flow rate Optimum screw angle	165

4.2-6	Effect of back pressure	168
4.2-7	Recent developments	169
4.2-8	Conclusion	170
4.2-9	Remarks on the solution of Equation 4.2-21	170
4.3	The plastication of polymer	171
4.3-1	Phenomenological considerations	171
	a) Delay zone	172
	b) Initiation of plastication	173
	c) Back flight plastication	174
4.3-2	Initiation of plastication	175
4.3-3	Modelling of the back flight plastication	176
	a) Plastication rate	176
	b) Optimum plastication rate	178
	c) Effect of flight clearance	179
4.3-4	Length of the plastication zone	181
	a) Constant depth channel	181
	b) Effect of compression	182
	c) Types of screw	183
4.3-5	Recent theories	184
4.3-6	Conclusions	184
	Problems 4.3	187
4.4	Flow of molten polymer in extruders	190
4.4-1	Metering zone	191
	a) Geometry	191
	b) Equation of motion	192
	c) Transverse flow	193
	d) Axial flow	195
4.4-2	Compression zone	198
	a) Simplified results	199
	b) Effect of pressure gradient	200
	c) Effect of relative motion	200
	d) Effect of solid bed	202
4.4-3	Clearance flow	203
4.4-4	Thermal effects	204
4.4-5	Pressure profile in the entire extruder	207
4.4-6	Conclusion	208
	Problem 4.4	209
4.5	Modelling of single screw extrusion	210
4.5-1	Introduction	210
4.5-2	Numerical applications for the reference extruder	210
4.5-3	A second example	214
4.5-4	Conclusion	216

Chapter 5 Dynamics of Film and Fiber Forming	219
5.1 Stretching of a liquid	219
5.1-1 Elongational viscosity	219
5.1-2 Fiber spinning	221
5.1-3 Isothermal melt spinning of a Newtonian fluid	222
a) Dynamic simplifications	222
b) Set of equations	223
c) Validity of the approximations used	225
5.1-4 Isothermal melt spinning of a viscoelastic fluid	227
a) Equations	227
b) Dimensionless equations	228
c) Solution	229
d) Results	229
5.1-5 Modelling of the air drawing process	231
a) Dynamic equilibrium equation	231
b) Force balance at the filament surface	232
c) Newtonian hypothesis	233
d) Heat transfer equations	234
e) Solution for the momentum and heat transfer equations	236
f) Results	237
5.2 Biaxial drawing; application to the cast film process	239
5.2-1 Biaxial stretching of a Newtonian liquid	239
5.2-2 Extrusion of cast film	240
a) Velocity field	241
b) Stress boundary conditions	242
c) Equation of motion	243
5.2-3 Isothermal Newtonian stretching	245
a) Stretching stress	245
b) Sheet stretching equations	246
c) Film shrinkage	247
d) Velocity field and film thickness	247
e) Comments on shrinkage	248
f) Example	249
5.2-4 Conclusion	250
Problems 5.2	250
5.3 Blown film	252
5.3-1 Description of the process	252
5.3-2 Film geometry	254
5.3-3 Kinematics of the bubble formation	255
5.3-4 Stresses acting on the bubble	255
a) Principal stresses	255
b) Force balance in the pulling direction and meridian stresses	256
c) Force balance perpendicular to the film	257
d) Order of magnitude of the stress components	258
5.3-5 The Newtonian approximation	259
5.3-6 Various bubble shapes	262

Chapter 6 Viscoelasticity of Polymer Liquids	263
6.1 Viscoelasticity of liquids	263
6.1-1 Phenomena	263
a) Extrudate swell	263
b) Weissenberg effect	264
c) Time effects	265
6.1-2 Linear viscoelasticity	267
a) General considerations	267
b) The Maxwell model	268
6.1-3 Normal stress differences	271
6.1-4 Extrudate swell	273
6.1-5 Molecular considerations	275
a) Time effects	275
b) Normal stress differences	276
6.1-6 Convected Maxwell model	277
a) A first generalization of the Maxwell model	277
b) Convected derivative	279
c) Convected Maxwell model	280
d) Dimensionless numbers	281
6.1-7 Other viscoelastic models	282
a) Generalized Newtonian models	282
b) Integral constitutive equations	282
c) Differential constitutive equations	283
d) Choice of rheological model	284
6.1-8 Viscoelastic fluid flow simulation	285
Problems 6.1	287
6.2 Measurement of viscoelastic properties	290
6.2-1 Cone-and-plate rheometer	290
a) Kinematics approximation	291
b) Viscometric functions	292
c) Equation of motion	292
d) Small cone angle limit	293
e) Example	295
f) Unsteady-state experiments	297
6.2-2 Orthogonal rheometer	299
a) Kinematics	299
b) General viscoelastic behaviour	300
c) Special cases	301
6.2-3 Balance rheometer	304
6.3 Flow instabilities in viscoelastic liquids	305
6.3-1 Main phenomena	305
6.3-2 Analysis of draw resonance	308
a) Isothermal Newtonian fluid	308
b) Non isothermal Newtonian fluid	309
c) Viscoelastic fluids	310
6.3-3 Melt fracture	310
a) Entry flow vortices	311

	b) Flow visualization in capillaries	312
	c) Pressure-flow rate relationship in a capillary rheometer	312
	d) Flow birefringence	314
6.3-4	Analysis of extrudate distortions	315
	a) Poiseuille flow stability	315
	b) Highly elastic state	315
	c) Melt fracture	315
	d) Slip-stick phenomenon	317
	e) Flow re-arrangement at the die exit	317
	f) Non-monotonous stress response	317
	g) Cyclic relaxation	317
	h) Secondary flow instability	318
6.3-5	Instability criteria	319
	a) Critical shear stress	319
	b) Weissenberg number	320
Appendices		321
Appendix A	Basic Formulae	323
A.1	Cylindrical coordinates	323
A.2	Spherical coordinates	324
A.3	Table of the error function (erf x)	326
Appendix B	Elements of Tensor Analysis	327
B.1	Invariants of a tensor	327
	B.1-1 Definitions	327
	B.1-2 Invariants used in fluid mechanics	328
B.2	Convected derivative	329
	B.2-1 Curvilinear coordinates	329
	B.2-2 Expression for a tensor	330
	B.2-3 Transformation of a tensor	331
	B.2-4 Weight of a tensor	332
	B.2-5 Time derivative of a tensor	333
Appendix C	Viscosity of polymeric liquids	341
C.1	Purely viscous liquids	341
	C.1-1 Newtonian liquid	341
	C.1-2 The Rivlin liquid	341
	C.1-3 Power-law model	342
	C.1-4 Generalized shear-thinning liquids	343
C.2	Molecular aspects of viscosity	343
	C.2-1 Eyring theory	343
	C.2-2 Molecular-weight dependence of polymer viscosity	346
	C.2-3 Shear-thinning properties of polymers	350
C.3	Elastic dumbbell rheological models	352
	C.3-1 Interest of dumbbell models	352
	C.3-2 Physics of dumbbell models	353
	C.3-3 Dumbbell deformation in shear flow	354
	C.3-4 Deformation in complex flow	359
	C.3-5 Deformation in extensional flow	360

	C.3-6	Concluding remarks	361
C.4		Variation of viscosity with temperature and pressure . .	362
	C.4-1	The Andrade law	362
	C.4-2	The WLF expression	363
	C.4-3	Free volume theory	364
	C.4-4	Effect of pressure on the viscosity	366
Appendix D		Complements on heat transfer	369
	D.1	Convection	369
		D.1-1 Free and forced convection	369
		D.1-2 The Bénard problem	369
		D.1-3 Other usual dimensionless numbers	372
		D.1-4 Physical properties of air and water	374
		D.1-5 Free convection correlations	375
	D.2	Forced convection	378
		D.2-1 General expressions	378
		D.2-2 Forced convection correlations	379
	D.3	Radiative heat transfer	381
		D.3-1 Black body	381
		D.3-2 Nonblack bodies	382
		D.3-3 Radiant heat exchange between grey bodies . . .	383
	D.4	Cooling of polymeric films in air or water	385
		D.4-1 Problem statement	385
		D.4-2 General solution	386
		D.4-3 Cooling in air	387
		D.4-4 Cooling in water	390
	D.5	Analogy between heat and momentum transfer	391
		D.5-1 Momentum transfer	391
		D.5-2 Flow of two immiscible liquids	393
Appendix E		Complements on extrusion	395
	E.1	Hydrodynamical lubrication approximations	395
	E.2	Complements on extrusion	397
		E.2-1 Simultaneous plastication and melt flow in the com- pression zone of an extruder	397
		E.2-2 Leakage flow	398
Appendix F		Solutions to Problems	403
	F.1	Solutions to Problems of Chapter 1	403
	F.2	Solutions to Problems of Chapter 3	407
	F.3	Solutions to Problems of Chapter 4	417
	F.4	Solutions to Problems of Chapter 5	426
	F.5	Solutions to Problems of Chapter 6	431
Notations			447
