

Contents

Chapter I. Arithmetic Encoding

1. Polynomials	1
2. Sums of Powers	8
3. The Cantor Pairing Function	14
4. The Fueter-Pólya Theorem, I	23
*5. The Fueter-Pólya Theorem, II	31
6. The Chinese Remainder Theorem	43
7. The β -Function and Other Encoding Schemes	52
8. Primitive Recursion	57
*9. Ackermann Functions	70
10. Arithmetic Relations	81
11. Computability	93
12. Elementary Recursion Theory	111
13. The Arithmetic Hierarchy	130
14. Reading List	136

Chapter II. Diophantine Encoding

1. Diophantine Equations; Some Background	140
2. Initial Results; The Davis-Putnam-Robinson Theorem	148
3. The Pell Equation, I	162
4. The Pell Equation, II	179
5. The Diophantine Nature of R.E. Relations	189
6. Applications	197
7. Forms	212
*8. Binomial Coefficients	222
*9. A Direct Proof of the Davis-Putnam-Robinson Theorem	228
*10. The 3-Variable Exponential Diophantine Result	243
11. Reading List	262

Chapter III. Weak Formal Theories of Arithmetic

1. <i>Ignorabimus?</i>	266
2. Formal Language and Logic	271
3. The Completeness Theorem	291
4. Presburger-Skolem Arithmetic; The Theory of Addition	307
*5. Skolem Arithmetic; The Theory of Multiplication	329
6. Theories with + and $\cdot$; Incompleteness and Undecidability	334

7. Semi-Representability of Functions	354
8. Further Undecidability Results	368
9. Reading List	390
Index of Names	395
Index of Subjects	399
