

Contents

1	Introduction — 1
2	Rank-structured formats for multidimensional tensors — 9
2.1	Some notions from linear algebra — 9
2.1.1	Vectors and matrices — 9
2.1.2	Matrix–matrix multiplication. Change of basis — 11
2.1.3	Factorization of matrices — 13
2.1.4	Examples of rank decomposition for function related matrices — 15
2.1.5	Reduced SVD of a rank- R matrix — 18
2.2	Introduction to multilinear algebra — 18
2.2.1	Full format d th order tensors — 19
2.2.2	Canonical and Tucker tensor formats — 23
2.2.3	Tucker tensor decomposition for full format tensors — 27
2.2.4	Basic bilinear operations with rank-structured tensors — 33
3	Rank-structured grid-based representations of functions in \mathbb{R}^d — 37
3.1	Super-compression of function-related tensors — 37
3.1.1	Prediction of approximation theory: $O(\log n)$ ranks — 38
3.1.2	Analytic methods of separable approximation of multivariate functions and operators — 39
3.1.3	Tucker decomposition of function-related tensors — 43
3.2	Multigrid Tucker tensor decomposition — 53
3.2.1	Examples of potentials on lattices — 60
3.2.2	Tucker tensor decomposition as a measure of randomness — 62
3.3	Reduced higher order SVD and canonical-to-Tucker transform — 62
3.3.1	Reduced higher order SVD for canonical target — 63
3.3.2	Canonical-to-Tucker transform via RHOSVD — 66
3.3.3	Multigrid canonical-to-Tucker algorithm — 69
3.4	Mixed Tucker-canonical transform — 73
3.5	On Tucker-to-canonical transform — 76
4	Multiplicative tensor formats in \mathbb{R}^d — 79
4.1	Tensor train format: linear scaling in d — 79
4.2	$O(\log n)$ -quantics (QTT) tensor approximation — 82
4.3	Low-rank representation of functions in quantized tensor spaces — 84
5	Multidimensional tensor-product convolution — 87
5.1	Grid-based discretization of the convolution transform — 87
5.2	Tensor approximation to discrete convolution on uniform grids — 90

5.3	Low-rank approximation of convolving tensors —	92
5.4	Algebraic recompression of the sinc approximation —	94
5.5	Numerical verification on quantum chemistry data —	95
6	Tensor decomposition for analytic potentials —	99
6.1	Grid-based canonical/Tucker representation of the Newton kernel —	99
6.2	Low-rank representation for the general class of kernels —	102
7	The Hartree–Fock equation —	105
7.1	Electronic Schrödinger equation —	105
7.2	The Hartree–Fock eigenvalue problem —	106
7.3	The standard Galerkin scheme for the Hartree–Fock equation —	107
7.4	Rank-structured grid-based approximation of the Hartree–Fock problem —	109
8	Multilevel grid-based tensor-structured HF solver —	111
8.1	Calculation of the Hartree and exchange operators —	111
8.1.1	Agglomerated representation of the Galerkin matrices —	112
8.1.2	On the choice of the Galerkin basis functions —	114
8.1.3	Tensor computation of the Galerkin integrals in matrices $J(D)$ and $K(D)$ —	115
8.2	Numerics on three-dimensional convolution operators —	117
8.3	Multilevel rank-truncated self-consistent field iteration —	121
8.3.1	SCF iteration by using modified DIIS scheme —	122
8.3.2	Unigrid and multilevel tensor-truncated DIIS iteration —	123
9	Grid-based core Hamiltonian —	129
9.1	Tensor approach for multivariate Laplace operator —	129
9.2	Nuclear potential operator by direct tensor summation —	132
9.3	Numerical verification for the core Hamiltonian —	136
10	Tensor factorization of grid-based two-electron integrals —	141
10.1	General introduction —	141
10.2	Grid-based tensor representation of TEI in the full product basis —	143
10.3	Redundancy-free factorization of the TEI matrix B —	145
10.3.1	Grid-based 1D density fitting scheme —	145
10.3.2	Redundancy-free factorization of the TEI matrix B —	148
10.3.3	Low-rank Cholesky decomposition of the TEI matrix B —	152
10.4	On QTT compression to the Cholesky factor L —	154
11	Fast grid-based Hartree–Fock solver by factorized TEI —	157
11.1	Grid representation of the global basis functions —	157

11.2	3D Laplace operator in $O(n)$ and $O(\log n)$ complexity	159
11.3	Nuclear potential operator in $O(n)$ complexity	160
11.4	Coulomb and exchange operators by factorized TEI	161
11.5	Algorithm of the black-box HF solver	163
11.6	Ab initio ground state energy calculations for compact molecules	165
11.7	On Hartree–Fock calculations for extended systems	168
11.8	MP2 calculations by factorized TEI	171
11.8.1	Two-electron integrals in a molecular orbital basis	172
11.8.2	Separation rank estimates and numerical illustrations	173
11.8.3	Complexity bounds, sketch of algorithm, QTT compression	176
12	Calculation of excitation energies of molecules	179
12.1	Numerical solution of the Bethe–Salpeter equation	179
12.2	Prerequisites from Hartree–Fock calculations	180
12.3	Tensor factorization of the BSE matrix blocks	182
12.4	The reduced basis approach using low-rank approximations	185
12.5	Approximating the screened interaction matrix in a reduced-block format	190
12.6	Inverse iteration for diagonal plus low-rank matrix	194
12.7	Inversion of the block-sparse matrices	196
12.8	Solving BSE spectral problems in the QTT format	198
13	Density of states for a class of rank-structured matrices	201
13.1	Regularized density of states for symmetric matrices	202
13.2	General overview of commonly used methods	204
13.3	Computing trace of a rank-structured matrix inverse	205
13.4	QTT approximation of DOS via Lorentzians: rank bounds	209
13.5	Interpolation of the DOS function by using the QTT format	211
13.6	Upper bounds on the QTT ranks of DOS function	213
14	Tensor-based summation of long-range potentials on finite 3D lattices	215
14.1	Assembled tensor summation of potentials on finite lattices	217
14.2	Assembled summation of lattice potentials in Tucker tensor format	222
14.3	Assembled tensor sums in a periodic setting	224
14.4	QTT ranks of the assembled canonical vectors in the lattice sum	227
14.5	Summation of long-range potentials on 3D lattices with defects	230
14.5.1	Sums of potentials on defected lattices in canonical format	231
14.5.2	Tucker tensor format in summation on defected lattices	232
14.5.3	Numerical examples for non-rectangular and composite lattices	233
14.6	Interaction energy of the long-range potentials on finite lattices	237

15	Range-separated tensor format for many-particle systems —	241
15.1	Tensor splitting of the kernel into long- and short-range parts —	243
15.2	Tensor summation of range-separated potentials —	245
15.2.1	Quasi-uniformly separable point distributions —	246
15.2.2	Low-rank representation to the sum of long-range terms —	247
15.2.3	Range-separated canonical and Tucker tensor formats —	254
15.3	Outline of possible applications —	260
15.3.1	Multidimensional data modeling —	260
15.3.2	Interaction energy for many-particle systems —	263
15.3.3	Gradients and forces —	266
15.3.4	Regularization scheme for the Poisson–Boltzmann equation —	268
