

# Contents

<b>Introduction .....</b>	<b>1</b>
<b>1. Lecture 1 – Master Equations and Sources I</b>	
1.1 Photoemissive sources.....	5
1.2 Master equations .....	6
1.3 Master equation for a cavity mode driven by thermal light...	9
1.4 The cavity output field.....	13
1.5 Correlations between the free field and the source field .....	16
<b>2. Lecture 2 – Master Equations and Sources II</b>	
2.1 Two-state atoms.....	22
2.2 Master equation for a two-state atom in thermal equilibrium	24
2.3 Phase destroying processes.....	28
2.4 The radiated field.....	33
2.5 Other sources: resonance fluorescence, lasers, parametric oscillators.....	35
<b>3. Lecture 3 – Standard Methods of Analysis I</b>	
3.1 Operator expectation values.....	39
3.2 Correlation functions: the quantum regression theorem .....	41
3.3 Optical spectra .....	46
3.4 The Hanbury-Brown-Twiss effect.....	52
3.5 Photon antibunching.....	53
<b>4. Lecture 4 – Standard Methods of Analysis II</b>	
4.1 Quantum-classical correspondence.....	58
4.2 Fokker-Planck equation for a cavity mode driven by thermal light .....	64
4.3 Stochastic differential equations.....	67
4.4 Linearization and the system size expansion .....	68
4.5 The degenerate parametric oscillator .....	73
<b>5. Lecture 5 – Photoelectric Detection I</b>	
5.1 Photoelectron counting for a constant intensity classical field	78
5.2 Photoelectron counting for general classical field.....	80

5.3 Moments of the counting distribution .....	82
5.4 The waiting-time distribution .....	86
5.5 Photoelectron counting for quantized fields .....	88
<b>6. Lecture 6 – Photoelectric Detection II</b>	
6.1 Squeezed light .....	93
6.2 Homodyne detection: the spectrum of squeezing .....	100
6.3 Vacuum fluctuations .....	103
6.4 Squeezing spectra for the degenerate parametric oscillator ...	107
6.5 Photoelectron counting for the degenerate parametric oscillator	110
<b>7. Lecture 7 – Quantum Trajectories I</b>	
7.1 Exclusive and nonexclusive photoelectron counting probabilities .....	114
7.2 The distribution of waiting times .....	116
7.3 Quantum trajectories from the photoelectron counting distribution .....	117
7.4 Unravelling the master equation for the source .....	121
7.5 Stochastic wavefunctions .....	122
<b>8. Lecture 8 – Quantum Trajectories II</b>	
8.1 Damped atoms and cavities .....	126
8.2 Resonance fluorescence .....	130
8.3 Cavity mode driven by thermal light .....	134
8.4 The degenerate parametric oscillator .....	136
8.5 Complementary unravellings .....	138
<b>9. Lecture 9 – Quantum Trajectories III</b>	
9.1 The riddle of squeezed light .....	140
9.2 Homodyne detection .....	143
9.3 Nonclassical photoelectron correlations .....	146
9.4 Stochastic Schrödinger equation for the degenerate parametric oscillator .....	148
9.5 Nonlocality .....	152
<b>10. Lecture 10 – Quantum Trajectories IV</b>	
10.1 Single-atom absorptive optical bistability .....	155
10.2 Strong coupling: cavity QED .....	160
10.3 Spontaneous dressed-state polarization .....	162
10.4 Semiclassical analysis .....	164
10.5 Quantum stability, phase switching, and Schrödinger cats...	166
<b>Postscript</b> .....	174
