

Contents

Preface — VII

About the author — XI

Chapter 1

Introduction: What this book is all about? — 1

Chapter 2

Topics in random vibration of structures — 3

- 2.1 Introduction — 3
- 2.2 Statistical energy analysis versus random vibrations — 4
- 2.3 Crandall's problem and cross-correlations — 6
- 2.4 Which deterministic theories to utilize? — 14
- 2.5 Is stochastic linearization a "dead" subject? — 16
- 2.6 Arbitrary randomization and physical sense do not always go together — 20
- 2.7 Can we reliably predict small probabilities of failure? — 22
- 2.8 Some relevant comments of A. Freudenthal — 23
- 2.9 Summary and conclusion — 26

Chapter 3

Essay on reliability index, probabilistic interpretation of safety factor, and worst-case design — 29

- 3.1 Introduction — 29
- 3.2 Basic concepts — 30
- 3.3 How accurate is minimum distance reliability index? — 36
- 3.4 Remarks on safety factor — 38
- 3.5 Sensitivity of failure probability — 41
- 3.6 Remarks on convex modelling of uncertainty — 48
- 3.7 Summary and conclusion — 55

Chapter 4

Finite element method based on either stochasticity, fuzziness, or anti-optimization — 57

- 4.1 Introduction — 57
- 4.2 Large-deviation FEM based on stochastic variational principles — 59
- 4.3 Interval finite element method based on anti-optimization idea — 63
- 4.4 Fuzzy finite element method — 67
- 4.5 Hybrid techniques should be sought — 67
- 4.6 Comparison of probabilistic modeling and anti-optimization — 68

- 4.7 In different circumstances, either probabilistic analysis or convex modeling can be more robust than the other — **69**
- 4.8 More discussion — **70**

Chapter 5

Seven decades of progress in stochastic linearization technique — 74

- 5.1 Introduction — **74**
- 5.2 A system possessing a nonlinear stiffness — **76**
- 5.3 Discussion of eqs. (5.14) and (5.15) — **78**
- 5.4 Stochastic linearization via Galerkin technique — **80**
- 5.5 Generalization of Anh and Di Paola version — **82**

Chapter 6

Essay on the role of the Monte Carlo method in stochastic mechanics — 96

- 6.1 Introduction — **96**
- 6.2 Probability and computers — **98**
- 6.3 Closed-form and numerical solutions: friends or foes? — **101**
- 6.4 Positive interplay between numeric analysis and analytics — **102**
- 6.5 Do not overemphasize neither asymptotology nor simulation — **103**
- 6.6 Stochasticity combined with asymptotology is not enough — **104**
- 6.7 About modeling — **105**
- 6.8 About required precision: accountability — **106**
- 6.9 Generating randomness from chaos? — **106**
- 6.10 An essential question — **108**
- 6.11 Conclusion — **109**

Chapter 7

Fuzzy sets-based interpretation of the safety factor — 114

- 7.1 Introduction — **114**
- 7.2 Probabilistic interpretation of the safety factor — **116**
- 7.3 Concepts of reliability and safety factor are compatible — **118**
- 7.4 Fuzzy safety factor — **121**
- 7.5 Bounds on reliability in a basic problem of the strength of materials — **125**
- 7.6 Triangular fuzzy stress — **128**
- 7.7 Quadratic fuzzy stress — **133**
- 7.8 Conclusion — **137**

Chapter 8

Possible limitations of probabilistic methods in engineering — 139

- 8.1 The idea of the poll — **139**
- 8.2 Responses of the researchers — **140**

- 8.3 Concluding remarks — 162
- 8.4 The list of poll participants — 164

Chapter 9

What may go wrong with probabilistic methods — 166

- 9.1 Introduction — 166
- 9.2 How reliable are reliability calculations? — 169
- 9.3 Effect of a small deviation in the probability density — 171
- 9.4 Conclusion — 176

Chapter 10

From A. M. Freudenthal's criticisms to optimization and anti-optimization or Wald's Min-Max — 177

- 10.1 Introduction — 177
- 10.2 Influence of imprecise data — 178
- 10.3 Effects of human error — 181
- 10.4 Convex models of uncertainty — 186
- 10.5 Davies-Hammond bound — 191
- 10.6 Bounds by Drenick and Shinozuka — 192
- 10.7 Convex modeling of base excitation — 194
- 10.8 Robust control under bounded excitation — 202
- 10.9 Response variability of viscoelastic structures — 202
- 10.10 Nagging question — 203
- 10.11 Critical comparison of probabilistic and convex approaches — 204
- 10.12 Combined probabilistic-convex method — 208
- 10.13 Concluding remarks — 215
- 10.14 Needs for further research — 223

Chapter 11

Probability and convexity concepts are perfectly compatible — 225

- 11.1 Introduction — 225
- 11.2 Compatibility of convexity and probability — 226
- 11.3 Problem statement — 227
- 11.4 Measure of structural non-probabilistic safety based on convex model — 229
- 11.5 Comparison between interval analysis and convex model method — 234
- 11.6 Interrelation between probability and convex models — 236
- 11.7 Transition from probabilistic to convex modeling — 240
- 11.8 Univariate analysis based on stochastic model — 240

- 11.9 Bivariate analysis based on stochastic model — **241**
- 11.10 Numerical examples — **244**
- 11.11 Conclusion — **254**

Chapter 12

Conclusion: each uncertainty analysis is right — 256

- 12.1 Preliminary comments — **256**
- 12.2 Stochasticity — **258**
- 12.3 Fuzziness — **259**
- 12.4 Boundedness (Wald's min-max; guaranteed approach; convex modeling; optimization and anti-optimization under uncertainty; info-gap) — **261**
- 12.5 Mediation of the dispute between litigants: First parable — **264**
- 12.6 Which analysis is right: Second parable — **265**
- 12.7 Third parable: Blind men and an elephant — **267**
- 12.8 Picking and choosing an uncertainty quantification methodology — **269**
- 12.9 Where are we going: The Rashomon effect? — **269**
- 12.10 Conclusion — **271**

Bibliography — 273

Author Index — 339

Subject Index — 359
