**Preface to 2<sup>nd</sup> ed – a small vote for this book — V**

## **Chapter 1**

### **Introduction – a thread through this book — 1**

- 1.1 Motivation – window shopping for biotechnological products — **1**
- 1.2 Bioprocesses – what they are and what they are able to do — **6**
  - 1.2.1 Bioprocess engineering – attempt at a definition — **6**
  - 1.2.2 Yeast production – a classic but instructive process — **9**
  - 1.2.3 The three columns of bioprocess engineering – what bioprocesses have in common — **11**
  - 1.2.4 Microalgae – biomass of the “third generation” — **13**
- 1.3 Integration – goals, methods, ways of thinking — **15**
  - 1.3.1 Integration of sciences – acquiring knowledge on demand — **15**
  - 1.3.2 Bringing microorganisms to work – the concept of “cell factory” — **17**
  - 1.3.3 Characteristics of living cells – unique selling points from engineering view — **18**
  - 1.3.4 Integration into society – the final meaning of bioprocesses — **19**
- 1.4 Exercises, questions, and suggestions — **20**

## **Chapter 2**

### **Biosystems – microorganisms and other biocatalysts — 21**

- 2.1 Motivation – a first bioengineering view to microbiology — **22**
- 2.2 Diversity of biosystems – appearance in technical environments — **23**
  - 2.2.1 Enzymes – the universal toolbox for biocatalysis — **23**
  - 2.2.2 Bacteria – organisms for all seasons — **26**
  - 2.2.3 Archaea – the underestimated extremists — **28**
  - 2.2.4 Yeast – the working horses of bioprocesses — **29**
  - 2.2.5 Filamentous fungi – the broad-spectrum chemists — **31**
  - 2.2.6 Plant cells – slow but resourceful — **32**
  - 2.2.7 Animal cells – masters of protein decoration — **34**
  - 2.2.8 Organized communities – making rich booty as a consortium — **36**
- 2.3 Cultivation conditions – environmental parameters to take care about — **37**
  - 2.3.1 Primary nutritional groups — **37**
  - 2.3.2 Temperature — **39**
  - 2.3.3 Acidity and basicity — **42**
  - 2.3.4 Osmolality — **44**
- 2.4 How the choice of a microorganism influences the whole process — **45**
  - 2.4.1 Criteria for selection – going through main aspects of process design — **45**

|       |  |    |
|-------|--|----|
| 2.4.2 | The good, the bad, and the ugly – microorganisms as products —                     | 47 |
| 2.5   | Running example: microalgae – the solar cell factory —                             | 50 |
| 2.5.1 | Choosing from diversity – widely employed microalgae for commercial bioprocesses — | 51 |
| 2.5.2 | Production of microalgae – a means to tackle ongoing challenges —                  | 55 |
| 2.5.3 | What else to learn from microalgae – awareness and sustainability —                | 58 |
| 2.6   | Questions and suggestion —   | 59 |

### **Chapter 3**

#### **Media – supplying microorganisms with a comfortable environment and building blocks for growth — 60**

|     |   |    |
|-----|---|----|
| 3.1 | Media – the chemical basis of the process —                         | 60 |
| 3.2 | Media design – starting from scratch —                              | 61 |
| 3.3 | Practical application – a discussion of recipes from references —   | 68 |
| 3.4 | Complex and technical media —                                       | 74 |
| 3.5 | Additional aspects – mutual interactions between cells and medium — | 79 |
| 3.6 | Media for microalgae – a clear matter of fact —                     | 82 |
| 3.7 | Light – the little bit different energy source —                    | 86 |
| 3.8 | Questions and suggestions —   | 89 |

### **Chapter 4**

#### **Kinetics – finding quantities for bioprocess reactions — 90**

|     |  |     |
|-----|--|-----|
| 4.1 | Kinetics – the scaffold of reaction engineering —  | 90  |
| 4.2 | Enzymes as basic components – determining kinetics —   | 92  |
| 4.3 | The specific growth rate – describing growth by numbers —  | 101 |
| 4.4 | The yield coefficient – combining substrate turnover and growth —  | 106 |
| 4.5 | Kinetics can also work linearly – basic kinetics of processes with alternative redox and energy supply — | 111 |
| 4.6 | The batch process – the simplest form of a bioprocess strategy —   | 113 |
| 4.7 | Questions and suggestions —  | 117 |

### **Chapter 5**

#### **Bioreactors – designing a home for the bioreaction — 118**

|     |  |     |
|-----|--|-----|
| 5.1 | Not only a vessel – for what a bioreactor is needed and what it can be —                             | 118 |
| 5.2 | Revisiting the stirred tank reactor – the most important issues to learn from chemical engineering — | 120 |
| 5.3 | Pneumatically driven bioreactors – a soft way of energy transfer —                                   | 131 |
| 5.4 | Other types of bioreactors – translating demands into design —                                       | 135 |

- 5.5 Gas transfer – supplying microorganisms with gaseous compounds — **144**
- 5.5.1 Transport processes – the journey of gases through the reactor — **145**
- 5.5.2 Measuring gas transfer — **151**
- 5.5.3 Alternative means of gas supply — **154**
- 5.6 Questions and suggestions — **156**

## **Chapter 6**

### **Not always so simple – the batch process reconsidered — 157**

- 6.1 Formal kinetics – extrapolation from enzymatic reactions to cell growth — **157**
- 6.2 Looking a step deeper – estimating aerobic growth yields from metabolic fluxes — **159**
- 6.3 Aerobic growth – case study heterotrophic plant cells — **161**
- 6.4 Looking a step deeper – estimating anaerobic product yields from metabolic fluxes — **165**
- 6.5 Anaerobic batch culture – case study ethanol production — **166**
- 6.6 Running example yeast production – growth in batch processes — **169**
- 6.7 Running example microalgae – how to deal with light as a nonmiscible substrate — **173**
- 6.8 Primary metabolites – products directly taken from central metabolism — **178**
- 6.9 Serving mankind with basic needs – products needed in large amounts — **181**
- 6.10 Conclusions for batch processes – dealing with pros and cons — **187**
- 6.11 Questions and suggestions — **189**

## **Chapter 7**

### **Little by little, one goes far – the fed-batch process — 190**

- 7.1 Setting up process equations – the formal deduction of a suitable feeding strategy — **191**
- 7.2 Running example, yeast production – an industrial feeding strategy — **194**
- 7.2.1 Deviations from exponential – controlling physiology and obeying technical constraints — **194**
- 7.3 Production of secondary metabolites – case study on penicillin production — **198**
- 7.4 Production of recombinant proteins – the cell factory — **203**
- 7.4.1 Different ways to get hold of desired proteins – an overview of protein expression systems — **204**
- 7.4.2 High-density cultivation – a specific fed-batch for recombinant protein production — **206**

- 7.4.3 Production of pharma proteins with *Komagataella*  
*pfaffii* – employment of a high-performance factory — **208**
- 7.5 Conclusions for fed-batch processes – dealing with strengths and  
weaknesses — **209**
- 7.6 Photobioreactors – the interface between algae and sun — **210**
- 7.6.1 Starting from natural conditions – lakes and open ponds — **211**
- 7.6.2 Flat plate reactors – the bubble column in an “enlightened” guise — **213**
- 7.6.3 Tubular reactors — **216**
- 7.6.4 New developments and ideas — **218**
- 7.7 Questions and suggestions — **219**

## **Chapter 8**

### **Bioseparation – the art of selectively directing particles and molecules — 220**

- 8.1 Identification of separation tasks – things to do around the  
whole process — **221**
- 8.2 Filtration – a smooth but not always simple approach — **223**
- 8.3 Centrifugation – a powerful and effective solid-liquid separation  
step — **226**
- 8.4 The idea of phase transitions – system changing as a separation  
concept — **230**
- 8.5 Extraction – the standard approach to separate small particles or  
molecules — **234**
- 8.6 Running example yeast production – relationship between cell  
separation and cell physiology — **238**
- 8.7 Ideas for additional forces and structures – a toolbox with short user  
instructions — **241**
- 8.7.1 Hydrodynamic forces — **241**
- 8.7.2 Electrical forces — **243**
- 8.7.3 Ideas for changing the structure – learning from nature — **246**
- 8.8 Questions and suggestions — **250**

## **Chapter 9**

### **Continuously operating bioprocesses – production under steady-state conditions — 251**

- 9.1 Setting up stationary balance equations – a good start for  
understanding process behavior — **252**
- 9.2 Ethanol production in a continuous process – the window of  
operation — **257**
- 9.3 Enzymatic processes – a simple but effective example for continuous  
bioprocess operation — **260**
- 9.4 Biogas production via anaerobic digestion — **262**

- 9.5 From minerals and particles – technical concepts for using chemolithotrophic microorganisms — **268**
- 9.6 Complex molecular structures – how they influence the process — **275**
- 9.7 Current discussion about continuous processes – motivation and obstacles — **279**
- 9.8 Questions and suggestions — **281**

## **Chapter 10**

### **Measuring principles – how to put an end to the blind flight — 282**

- 10.1 Only a look through the keyhole – what measurement means for process understanding and optimization — **282**
- 10.2 State of the art – overview of measurement at a standard reactor — **283**
- 10.3 Physical parameters – adaptation from other fields of process technology — **285**
- 10.4 Chemical parameters – employment of electrochemical effects — **286**
- 10.5 Measuring biomass – the great unknown “X” — **294**
- 10.6 Compiling a construction kit for sensors – a general approach for biological sensors — **300**
- 10.7 Questions and suggestions — **305**

## **Chapter 11**

### **The practice of fermentation – a step-by-step guide through the workflow — 306**

- 11.1 Structuring the reactor and the cultivation – zooming in from principle understanding to visibility of process details — **306**
- 11.2 The reactor – a complex assembly of parts and modules — **307**
- 11.3 Structuring the cultivation process – from planning to final data acquisition — **309**
- 11.4 Media preparation — **311**
- 11.5 Preculture preparation — **311**
- 11.6 Reactor installation and setup — **313**
- 11.6.1 Fermentation vessel setup — **313**
- 11.6.2 Peripheral devices — **314**
- 11.6.3 Sensor installation — **316**
- 11.6.4 Autoclaving the bioreactor — **317**
- 11.7 Managing the actual cultivation process — **321**
- 11.8 Sterilization – more than heating up — **326**
- 11.8.1 Thermal sterilization – the most important approach in process technology — **326**

- 11.8.2 Other problems – and other solutions — **328**
- 11.9 Integration on the process level – how to include fermentation into a whole process chain — **331**
- 11.10 Questions and suggestions — **333**

## **Chapter 12**

### **Modeling – the art and handcraft of mathematically describing bioprocesses — 334**

- 12.1 Modeling – what it might be and what it is good for — **334**
- 12.2 Predator-prey model — **338**
- 12.3 Linear networks – finding stationary flux equations — **341**
- 12.4 Aerobic growth – setting up the first general model — **342**
- 12.5 Anaerobic growth – traps and pitfalls — **346**
- 12.6 Back to baker's yeast – more degrees of freedom — **349**
- 12.7 Back to microalgae – more spatial and hierarchical structure for subsystem definition — **354**
- 12.8 Integration of products and processes into society – the final proof of meaning — **358**
- 12.9 Questions and suggestions — **362**
