Introduction	1
1 Generalities on abstract logics and sentential logics	13
2 Abstract logics as models of sentential logics	29
2.1 Models and full models	29
2.2 $\mathcal{S}$ -algebras	34
2.3 The lattice of full models over an algebra	38
2.4 Full models and metalogical properties	42
3 Applications to protoalgebraic and algebraizable logics	55
4 Abstract logics as models of Gentzen systems	69
4.1 Gentzen systems and their models	70
4.2 Selfextensional logics with Conjunction	80
4.3 Selfextensional logics having the Deduction Theorem	89
5 Applications to particular sentential logics	97
5.1 Some non-protoalgebraic logics	99
5.1.1 $\text{CPC}_{\mathcal{N}}$, the $\{\wedge, \vee\}$ -fragment of Classical Logic	99
5.1.2 The logic of lattices	101
5.1.3 Belnap's four-valued logic, and other related logics	102
5.1.4 The implication-less fragment of IPC and its extensions	104
5.2 Some Fregean algebraizable logics	105
5.2.1 Alternative Gentzen systems adequate for $\text{IPC}_{\perp}$, not having the full Deduction Theorem	107
5.3 Some modal logics	108
5.3.1 A logic without a strongly adequate Gentzen system	111

5.4	Other miscellaneous examples	111
5.4.1	Two relevance logics	112
5.4.2	Sette's paraconsistent logic	113
5.4.3	Tetravalent modal logic	114
5.4.4	Logics related to cardinality restrictions in the Deduction Theorem	115
