List of chapter authors — XV

Emmanuel Gillain

1 Preface and introduction — 1

1.1 Fast progress in artificial intelligence (AI) — **1**

1.2 Convergence of factors — **5**

1.2.1 The globalization and democratization of access to computing and AI resources — **6**

1.2.2 Dematerialization, digitization, and exponential growth of data — **7**

1.2.3 AI accelerators: AI techniques that speed up the adoption by the industry — **8**

1.2.4 The dynamics of software, amplified by open-source: reuse, iterative improvement and innovation — **9**

1.3 Opportunities and challenges for the industry — **10**

1.4 Purpose and target audience of the book: enlighten the business practitioners — **15**

Emmanuel Gillain

2 A holistic view of AI techniques, their limitations and complementarities — 19

2.1 What is artificial intelligence (AI)? — **19**

2.2 Decision by search and how an AI agent can construct a plan of actions — **21**

2.2.1 Overview and key concepts — **21**

2.2.2 Industry applications and examples in the book — **21**

2.2.3 Moving to constraint search — **22**

2.2.4 Constraint satisfaction propagation: applications and examples in the book — **23**

2.2.5 Limitations of search-based techniques — **23**

2.3 Represent knowledge and reason with symbolic AI — **24**

2.3.1 Overview and key concepts — **25**

2.3.2 Industry applications and examples in the book — **27**

2.3.3 Limitations of symbolic AI — **28**

2.4 Learning with data-driven AI — **30**

2.4.1 Overview — **30**

2.4.2 Supervised learning key concepts, industry applications and examples in the book — **31**

2.4.3 Unsupervised learning – key concepts, industry applications, and examples in the book — **32**

Bibliografische Informationen

digitalisiert durch DEUTSCHE NATIONAL BIBLIOTHEK

2.4.4 Anomaly detection – key concepts, industry applications, and examples in the book — **34**
2.4.5 Reinforcement learning: key concepts, industry applications, and examples in the book — **35**
2.4.6 What about deep learning? — **37**
2.4.7 Limitations of data-driven learning — **41**
2.5 Learning in a logic framework — **42**
2.5.1 Overview and key concepts — **42**
2.5.2 Industry applications and examples in the book — **43**
2.5.3 Limitations of inductive logic programming — **44**
2.6 Probabilistic reasoning when there is uncertainty — **44**
2.6.1 Key concepts—uncertain facts and outcomes with probabilistic reasoning — **45**
2.6.2 Industry application and examples from the book — **48**
2.6.3 Probabilistic reasoning over time, or sequence to sequence — **49**
2.6.4 Industry applications and examples from the book — **50**
2.6.5 Enrich the abstraction—unify probabilistic models and formal logic — **50**
2.6.6 Uncertain states or outcomes in the context of a decision — **51**
2.6.7 Limitations of probabilistic reasoning — **52**
2.7 Interaction with machines in natural language — **52**
2.7.1 Overview of some key concepts — **53**
2.7.2 Industry applications and examples in the book — **58**
2.7.3 Limitations of natural language processing — **59**
2.8 The importance of an ethical approach to AI — **60**

Yves Deville

3 Solve problems by searching, including with constraints, a fundamental pillar — 63
3.1 Why is solving problems by search important within the broader artificial intelligence (AI) domain? — **63**
3.2 Search algorithms — **64**
3.2.1 What category of problems do search algorithms solve? — **64**
3.2.2 Solving problems by search without heuristics — **65**
3.2.3 Solving problems by search with heuristics — **70**
3.2.4 What are the limitations of search algorithms? — **73**
3.2.5 Industry example. The fastest route with search and heuristics, using Bing Maps Routes API — **75**
3.3 Constraint satisfaction problems — **80**
3.3.1 What category of problems does constraint satisfaction solve? — **80**
3.3.2 Solving optimization problems by local search — **84**
3.3.3 Solving problems by constraint programming — **88**

3.3.4 What are the limitations of constraint satisfaction problems? — **93**
3.3.5 Industry example: containers configuration using CSP at Maersk Container Industry A/S — **94**
3.4 SAT solvers — **97**
3.4.1 What category of problems does SAT solvers solve? — **97**
3.4.2 Solving problems with SAT solvers — **98**
3.4.3 What are the limitations of SAT solvers? — **103**
3.4.4 Industry example: containers configuration using SAT, at Maersk Container Industry A/S — **104**

Bart Bogaerts
4 Reasoning with first-order logic — 107
4.1 Why is reasoning with first-order logic important within the broader artificial intelligence (AI) domain? — **107**
4.2 What category of problems does reasoning with first-order logic solve? — **109**
4.3 How are those problems solved? — **111**
4.3.1 Representing knowledge in first-order logic — **112**
4.3.2 Reasoning with first-order logic — **120**
4.4 What are the limitations of reasoning with first-order logic — **126**
4.5 Industry examples — **127**
4.5.1 Automated design-driven diagnostics for lithography machines at ASML — **127**
4.5.2 Modeling and verifying simple vehicle controller, such as the Triton unmanned aircraft systems of the US Navy: using Imandra system and first-order logic — **136**

Isabelle Linden
5 Knowledge representation and engineering with ontologies — 149
5.1 Why are knowledge representation and engineering with ontologies important within the broader AI domain? — **149**
5.2 What category of problems do knowledge representation and engineering with ontologies solve? — **151**
5.3 How are those problems solved? — **153**
5.3.1 $\mathcal{ALC}$ description logic formal definition — **154**
5.3.2 Queries and reasoning problems — **158**
5.4 What are the limitation of knowledge representation and engineering with ontologies? — **165**
5.4.1 Expressiveness and complexity of DLs — **165**
5.4.2 DLs expressiveness limitations and challenges — **167**
5.4.3 Knowledge engineering — **168**
5.4.4 OWL and the semantic web — **168**

5.4.5 Knowledge graphs — **169**
5.4.6 Conclusion — **170**
5.5 Industry example: drug development using ontologies and semantic search, the ONTOFORCE example — **171**
5.5.1 Context — **171**
5.5.2 Data is ubiquitous but siloed — **171**
5.5.3 ONTOFORCE — **172**
5.5.4 Use case introduction: semantics and ontologies in basic research — **174**
5.5.5 Use case scenario: semantics and linked data at work for knowledge discovery in early-stage drug research — **174**
5.5.6 Application of early-drug research knowledge for translational research use case — **176**

Aleksandra Pižurica
6 Probabilistic reasoning: When the environment is uncertain — 181
6.1 Why is probabilistic reasoning important within the broader AI domain? — **181**
6.2 What category of problems does probabilistic reasoning solve? — **183**
6.3 How probabilistic reasoning problems are solved? — **185**
6.3.1 Modeling causal problems with Bayesian networks — **185**
6.3.2 Modeling noncausal problems with Markov random fields — **188**
6.3.3 Modeling noncausal problems with conditional random fields — **193**
6.3.4 A unifying representation: factor graphs — **196**
6.3.5 Approximate inference algorithms — **198**
6.3.6 Probabilistic reasoning over time — **204**
6.4 What are the limitations of probabilistic reasoning? — **209**
6.5 Industry examples — **211**
6.5.1 Hunting for anomalous sessions using Markov chain model in Microsoft Sentinel — **211**
6.5.2 Crop forecasting with Bayesian inference for agriculture producers — **218**
6.5.3 Estimating players' skills with XBOX TrueSkill™ — **224**
6.6 Useful reminders of probability theory — **233**
6.6.1 Basic concepts in probability — **233**
6.6.2 Maximum likelihood estimation and Bayesian estimation — **236**

Hendrik Blockeel
7 Learning from data — 241
7.1 Why is learning important within the broader AI domain? — **241**
7.2 What category of problems does machine learning solve? — **243**
7.2.1 Learning predictive functions — **243**
7.2.2 Learning descriptive models — **247**

7.3 How are learning problems solved? — 250
7.3.1 From data to model: an overview — 250
7.3.2 Data collection and preparation — 250
7.3.3 Format of the data — 251
7.3.4 Paradigms for learning — 256
7.3.5 Instance-based methods — 258
7.3.6 Decision trees — 259
7.3.7 Ensembles of decision trees — 262
7.3.8 If-then-rules — 265
7.3.9 Statistical model fitting — 269
7.3.10 Support vector machines — 273
7.3.11 Neural networks — 277
7.3.12 Dimensionality reduction — 287
7.3.13 Matrix factorization and tensor decomposition — 289
7.3.14 Probabilistic graphical models — 291
7.3.15 Clustering and density estimation — 297
7.3.16 Automata and hidden Markov models — 299
7.3.17 Reinforcement learning — 301
7.3.18 Other aspects of learning — 306
7.4 Evaluating the results — 309
7.5 What are the limitations of learning? — 312
7.6 Industry examples — 314
7.6.1 Predicting the metallization rate in iron production using ensemble methods at ArcelorMittal — 314
7.6.2 Estimating the value of real estate with supervised regression models, at KBC Group — 319
7.6.3 Fraud detection in insurance claims with unsupervised outlier detection, at KBC Group — 322
7.6.4 Defect detection in textile using CNN, *k*-means clustering, and unsupervised anomaly detection, at Veranneman Technical Textiles — 329
7.6.5 Extracting information from forms using clustering techniques with Microsoft Form Recognizer — 333
7.6.6 Recommending pages in Microsoft News with reinforcement learning — 338

Walter Daelemans

8 Between language and knowledge — 343
8.1 Why is natural language processing important within the broader AI domain? — 343
8.1.1 A short history of NLP — 344
8.2 What category of problems does natural language processing solve? — 346

8.2.1 NLP tasks — **348**
8.2.2 Speech to text processing — **348**
8.2.3 Image to text processing — **349**
8.2.4 Text to text processing — **350**
8.3 How are natural language processing problems solved? — **352**
8.3.1 Static word embeddings — **352**
8.3.2 Language models — **354**
8.3.3 Transformers — **357**
8.3.4 Contextual word embeddings — **359**
8.3.5 From text to knowledge and back — **362**
8.4 What are the limitations of natural language processing? — **366**
8.5 Industry examples — **367**
8.5.1 Automate question answering using NLP with Microsoft QnAMaker — **368**
8.5.2 Extract information from contracts using NLP, the case of Daimler — **376**
8.5.3 Analyze legal content for lawyers at AXA's legal protection unit — **384**
8.6 Addendum — **392**

Erik Mannens
9 Some words about ethics. The angles of fairness and transparency — 395
9.1 The challenges of ethical AI — **395**
9.2 Initial framing of fairness — **396**
9.2.1 Generic definition on bias — **399**
9.2.2 What is the problem to solve? — **399**
9.2.3 How do we mitigate it? — **404**
9.2.4 When do we apply these techniques? — **406**
9.2.5 What are the limitations? — **407**
9.3 Initial framing of Interpretability — **409**
9.3.1 What is the problem to solve? — **410**
9.3.2 How do we mitigate it? — **411**
9.3.3 When do we apply these techniques? — **414**
9.3.4 What are the limitations? — **416**
9.4 Industry examples — **417**
9.4.1 Fair loan adjudication models with Fairlearn at EY — **417**
9.4.2 Detect and reduce fraud for loyalty services using InterpretML to respect ethical AI principles — **424**
9.5 Final conclusions on AI ethics — **428**

Oussama Chelly and Hendrik Blockeel
10 Industry examples where different AI techniques are combined — 431
10.1 An AI-enabled chatbot for the Casco insurance industry, an example from KBC Group — **431**

10.2 An automated engineering assistant that uses a mix of learning and reasoning techniques in manufacturing — **436**
10.2.1 The problem setting — **437**
10.2.2 How are those problems solved ? A mix of techniques from Chapters 4, 5, and 7 — **438**
10.2.3 How well does it work? — **443**

Emmanuel Gillain
11 Conclusion – Moving forward — 445
11.1 So far... — **445**
11.2 Moving forward — **445**
11.2.1 Hybrid AI systems to merge the best of both worlds — **446**
11.2.2 Cause-effect and causal AI — **447**
11.2.3 Generative AI — **449**
11.3 Final word — **451**

Trademarks — 453
