Kurzfassung	XV
Abstract	XVII

1 Introduction	1
1.1 Structure of this thesis	3
2 State-of-the-art environmental and economic assessment of the chemical industry	5
2.1 Status quo of the chemical industry	6
2.1.1 The chemical industry's impact on the global economy	6
2.1.2 Most relevant chemical products and scope of this thesis	8
2.1.3 Incumbent linear fossil production and end-of-life treatment	10
2.2 Renewable feedstocks and circular production	11
2.3 Assessing the environmental and economic sustainability of the chemical industry	14
2.3.1 Life Cycle Assessment	14
2.3.2 LCA's suitability for environmental sustainability assessment	19
2.3.3 The planetary boundaries framework	21
2.3.4 Aligned assessment of economic and environmental aspects	27
2.3.5 Economic sustainability in the context of this thesis	31
2.3.6 Suitability of transition pathways to align economic and environmental sustainability assessment	32
2.3.7 The Technology Choice Model	33
2.3.8 The Chemical Industry Model	35

2.4	Scientific gaps for assessing environmental and economic sustainability	36
2.5	Contribution of this thesis	38
3	Cost-optimal pathways towards a net-zero chemical industry	41
3.1	Methods for calculating cost-optimal transition pathways	42
3.1.1	Scope and functional unit	42
3.1.2	System boundaries	42
3.1.3	Existing production capacity in 2020	43
3.1.4	Investment decisions	44
3.1.5	Carbon pricing	44
3.1.6	Scenarios for prices, footprints, and available technologies	45
3.1.7	Dynamic expansion of the Technology Choice Model	46
3.2	Sustainable Development Scenario and carbon pricing incentives	47
3.3	Capital expenditures for net-zero GHG emissions	51
3.4	Technologies deployment of net-zero pathways	52
3.5	Residual GHG emissions of a net-zero chemical industry	56
3.6	Total annualized costs of net-zero supply chains	56
3.7	Resource consumption of net-zero supply chains	58
3.8	Availability of cheap and sustainable resources	60
3.9	The role of recycling for a transition towards net-zero GHG emissions .	62
3.10	Discussion	62
4	The cost and climate impact of myopic investment decisions in the chemical industry	65
4.1	Calculating transition pathways with myopic decision-making	66
4.1.1	Scope and functional unit	66
4.1.2	System boundaries	66
4.1.3	Modeling Perfect & limited foresight with the rolling horizon approach	66
4.1.4	Existing production capacity in 2020	67
4.1.5	Modeling investment decisions	68
4.1.6	Scenarios for transition pathways with myopic decision-making .	69
4.2	Myopic decision-making delays GHG mitigation	70
4.3	Myopic decision-making increases overall costs	73
4.4	Low-carbon technology deployment and stranded assets	75
4.5	Discussion	77

5	Towards an environmentally sustainable plastics industry	81
5.1	Assessing the plastics industry's absolute environmental sustainability .	82
5.1.1	Scope and functional unit	82
5.1.2	System boundaries	84
5.1.3	Definition of production systems	84
5.1.4	The planetary boundaries framework	85
5.1.5	Downscaling of the safe operating space	85
5.1.6	Technology Choice Model	86
5.2	The planetary boundary footprints of plastics	87
5.3	Recycling enhances the environmental sustainability of plastics	90
5.4	Bio- and CCU-based plastics can reduce climate change	91
5.5	Mitigating burden-shifting from bio-based plastics	92
5.6	Mitigating burden-shifting from CCU-based plastics	93
5.7	Towards environmental sustainability by improving recycling processes	94
5.8	Discussion	96
6	Summary, critical discussion, and outlook for future research	101
6.1	The environmental and economic sustainability of circular technologies	101
6.2	Critical discussion	103
6.2.1	The planetary boundaries framework's shortcomings in solving burden-shifting	103
6.2.2	Missing aspects of environmental and economic sustainability assessment	104
6.2.3	The social dimension completes the sustainability assessment . .	106
6.3	Outlook for future research	113

Appendices 119

A	Supplementary Information for cost-optimal transition pathways	121
A.1	Methodology for cost-optimal transition pathways	121
A.1.1	Time-resolved Technology Choice Model	121
A.1.2	Cost extension of the Chemical Industry Model	125
A.1.3	Production and waste volumes of chemicals and plastics	130
A.1.4	Scenarios for cost-optimal transition pathways	131
A.2	Supplementary results for cost-optimal transition pathways	136
A.2.1	Extrapolation of the chemical industry's capital expenditure . .	136
A.2.2	Storage capacities for carbon capture and storage	136

A.2.3	Sensitivity of the share of methanol production to electricity prices	137
B	Supplementary Information for myopic decision-making	139
B.1	Methodology for myopic decision-making	139
B.1.1	Parameterization of the rolling horizon	139
B.1.2	Implications of assumptions regarding electricity supply	140
B.1.3	Conservative estimate for biomass prices	141
B.1.4	Details on carbon pricing	141
B.2	Supplementary results and discussion for myopic decision-making	142
B.2.1	Net-zero supply chains of technology pathways	142
B.2.2	Sensitivity of myopic decision-making's impact on technology pathways	143
B.2.3	Fully grasping the impact of myopic decision-making on costs	147
B.2.4	Comparison between a 30-year foresight and perfect foresight	148
C	Supplementary Information for Planetary Boundaries	151
C.1	Methodology for calculating planetary footprints	151
C.1.1	Data for calculating planetary footprints	151
C.1.2	Adapting the planetary boundary framework	160
C.1.3	Inventory modeling	166
C.1.4	A regionally-adapted indicator for utilitarianism	167
C.2	Supplementary results for planetary footprints	169
C.2.1	Details on production systems	169
C.2.2	Contribution analysis	170
C.2.3	Sensitivity analysis for recycling technologies	170
C.2.4	Sensitivity analysis of biomass sources	172
C.2.5	Sensitivity analysis of renewable energy	175
C.2.6	Planetary footprints of plastics in 2050	178
