1	Introduction	1
2	Fundamentals	5
2.1	Mathematical Fundamentals	5
2.1.1	Collinearity of Points and Vectors	5
2.1.2	Change of Basis Transformation	5
2.1.3	Inverse and Pseudo-Inverse of a Matrix	8
2.1.4	Singular Value Decomposition	8
2.1.5	QR Decomposition	9
2.1.6	Gradient	10
2.1.7	Sobel Operator	10
2.1.8	Norms and Error Measures	10
2.1.9	Statistical Measures of Central Tendency	11
2.1.10	Regression Analysis: Methods of Solving Over-determined Systems	12
2.1.11	Quantization	14
2.1.12	Uniform Quantization	14
2.2	Fundamentals of Video Coding	16
2.2.1	Lossless and Lossy Coding	16
2.2.2	Video Format	17
2.2.3	Hybrid Video Coding	17
2.2.4	Predictive Coding	18
2.2.5	Intra Prediction in Video Coding	19
2.2.6	Inter Prediction in Video Coding	19
2.2.7	Estimation of Translational Motion Vectors in Video Coding	19
2.2.8	Motion Compensation in Video Coding	21
2.2.9	Video Distortion and Distance Metrics	22
2.2.10	Rate Distortion Optimization	23
2.2.11	Bjontegaard Metric	24
2.3	Inter Prediction in HEVC	25
2.3.1	Temporal and Spatial Structuring in HEVC	25
2.3.2	Motion Vectors and Motion Vector Fields in HEVC	27
2.3.3	Motion Vector Estimation	29
2.3.4	Motion Compensation in HEVC	30
2.3.5	RDO-based Motion Prediction Decisions	31
2.3.6	Motion Vector Signalling and Coding in HEVC	32
2.3.7	Motion Vector Prediction in HEVC	33
2.3.8	Motion Vector Prediction Modes	35
2.3.9	Reference Software for HEVC and beyond	37

3	State of the Art in Higher Order Motion Compensation	39
3.1	Beforehand, a little retrospection...	39
3.2	Gradient-based Affine Motion Estimation	41
3.2.1	Affine Parameter Estimation Algorithm	41
3.2.2	Integration into HEVC	42
3.2.3	Performance	43
3.3	Higher Order Motion from Control Points at Block Corners	43
3.3.1	Simplified Affine Motion from Two Block Corners	44
3.3.2	Affine Motion with up to Six Parameters from up to Three Block Corners	46
4	Higher Order Motion Models, their Parameter Estimation and Suitability	49
4.1	Motion in Video Sequences	49
4.1.1	Camera Models	50
4.1.2	Motion Representation in Image Plane	51
4.2	Parametric Motion Models	51
4.2.1	Translational Motion Model	52
4.2.2	Perspective Motion Model	53
4.2.3	Affine Motion Model	53
4.2.4	Zoom & Rotation Motion Model	55
4.2.5	Bilinear Motion Model	56
4.2.6	Quadratic Motion Model	56
4.3	Examination on Suitability of Higher Order Motion Models for HOMC	57
4.3.1	Motivation for Video Motion Representation beyond Translation	57
4.3.2	Considered Higher Order Motion Models	58
4.3.3	Parameter Estimation for Considered Motion Models	60
4.3.4	Motion Model Evaluation	65
4.3.5	Motion Transformation Representation with Homogenous Coordinates	68
4.4	Conversion between Motion Models	69
4.4.1	Translational Motion Model to/from Zoom&Rotation Motion Model	70
4.4.2	Translational Motion Model to/from Affine Motion Model	71
4.4.3	Zoom&Rotation Motion Model to/from Affine Motion Model	73
5	Higher Order Motion Compensation (HOMC) in HEVC	75
5.1	Integration and Adjustments	76
5.1.1	Estimation	76
5.1.2	Compensation	78
5.1.3	Interpolation	78
5.1.4	Quantization	81
5.1.5	Signaling and Coding	83
5.2	Experimental Results and Evaluation of HOMC in HEVC	84
5.2.1	Experimental Setup	84
5.2.2	Bit-Rate Reduction of HOMC-extended HEVC over Conventional HEVC	86
5.2.3	Evaluation	92
5.3	HOMC Performance for Coder Settings beyond HEVC	95
5.3.1	Increase of Maximum Coding Unit Size (CTU size)	95
5.3.2	Increase of Maximum Transform Unit Size (TU size)	98

6	Improvements of Prediction and Coding of Higher Order Motion Parameters	103
6.1	Block-to-Block Translational Shift Compensation	103
6.1.1	Motion Vector Predictor	103
6.1.2	Block-to-Block Deviation of Motion Parameter Predictor	104
6.1.3	Compensation of Translational Shift	105
6.1.4	BBTSC Algorithm	106
6.1.5	BBTSC in AMVP and MRG/SKIP Mode	107
6.1.6	Experimental Results and Evaluation of HOMC with BBTSC	111
6.2	Higher Order Distance Scaling	117
6.2.1	Conventional Distance Scaling as Performed on Translational Motion Vector Predictors in HEVC	117
6.2.2	Motivation for Higher Order Distance Scaling (HODS)	117
6.2.3	Distance Scaling of Higher Order Motion Parameters via Matrix De- composition	118
6.2.4	Experimental Results	127
6.3	Flexible Temporal Motion Parameter Prediction	130
6.3.1	Motivation for Flexible Temporal Motion Parameter Prediction	130
6.3.2	Density of Translational Motion Vector Field	132
6.3.3	Concept of FTMP	132
6.3.4	Conversion between Translational Motion Parameters and Transla- tional Motion Vector Fields	133
6.3.5	Conversion between Higher Order Motion Parameters and Transla- tional Motion Vector Fields	134
6.3.6	Generating PU-wise Translational Motion Parameters from Transla- tional Motion Vector Field	135
6.3.7	Generating PU-wise Higher Order Motion Parameters from Transla- tional Motion Vector Field	137
6.3.8	Integration of FTMP into Temporal Prediction Process	140
6.3.9	Temporal Prediction from TMVF in AMVP Mode	141
6.3.10	Temporal Prediction from TMVF in MRG/SKIP Mode	142
6.3.11	Experimental Results	142
7	Investigation of Improved HOMC Version	153
7.1	Combination of HODS and FTMP	153
7.2	Different Encoder Configurations	155
7.3	Motion Compensation - per Pixel or per Subpartition of 4×4 Pixels?	155
7.4	Sequence-wise Rate-Distortion-Curves	156
8	Conclusion and Outlook	157
8.1	Summary and Conclusion	157
8.2	Outlook	158
8.2.1	Higher Order Motion Parameter Estimation	158
8.2.2	HOMC Integration into Coding Process	158
8.2.3	Global Motion Compensation	159
8.2.4	HODS	160
8.2.5	FTMP	160

Contents

8.2.6	Efficient combination of HODS and FTMP	161
8.2.7	Conclusion of Outlook	162
Appendices		163
A Appendix		165
A.1	Sequences of the HOMC target group	165
A.2	Sequence-wise Rate-Distortion-Curves	169
A.2.1	BlueSky	170
A.2.2	BQSquare	172
A.2.3	Cactus	174
A.2.4	Jets	176
A.2.5	ShieldsPart	178
A.2.6	SlideShow	180
A.2.7	Spincalendar	182
A.2.8	Station	184
A.2.9	Tempete	185
A.2.10	TractorPart	188
