Introduction	v
<i>Chapter I</i>	
Homogeneous functions, Fourier transformation, and contact structures	1
1. Integration on manifolds	1
2. Analysis on \mathbf{RP}^n and smooth homogeneous functions on \mathbf{R}_*^{n+1}	11
3. Homogeneous and formally homogeneous distributions	24
4. Fourier transformation of homogeneous functions	30
5. Homogeneous symplectic and contact structures	44
6. Functorial properties of the phase space and local representation of Lagrangian manifolds. The classification lemma	63
<i>Chapter II</i>	
Fourier–Maslov operators	78
1. Maslov’s canonical operator (\mathbf{R}_* -equivariant theory)	78
2. Fourier–Maslov integral operators	112
3. Singularities of hyperbolic equations; examples and applications	137
<i>Chapter III</i>	
Applications to differential equations	149
1. Equations of principal type	149
2. Microlocal classification of pseudodifferential operators	175
3. Equations of subprincipal type	192
