Part 1

1	Basic Philosophy of CFD	3
1.1	Motivation: An Example	3
1.2	Computational Fluid Dynamics: What is it?	5
1.3	The Role of Computational Fluid Dynamics in Modern Fluid Dynamics	6
1.4	The Role of This Course	13
2	Governing Equations of Fluid Dynamics	15
2.1	Introduction	15
2.2	Modelling of the Flow	15
2.3	The Substantial Derivative	16
2.4	Physical Meaning of $\nabla \cdot \vec{V}$	22
2.5	The Continuity Equation	23
2.6	The Momentum Equation	27
2.7	The Energy Equation	33
2.8	Summary of the Governing Equations for Fluid Dynamics: With Comments	40
2.8.1	Equations for Viscous Flow	40
2.8.2	Equations for Inviscid Flow	42
2.8.3	Comments on the Governing Equations	43
2.8.4	Boundary Conditions	44
2.9	Forms of the Governing Equations Particularly Suited for CFD: Comments on the Conservation Form	45
3	Incompressible Inviscid Flows: source and vortex panel methods	52
3.1	Introduction	52
3.2	Some Basic Aspects of Incompressible, Inviscid Flow	52
3.2.1	Uniform Flow	53
3.2.2	Source Flow	54
3.2.3	Vortex Flow	54
3.3	Non-lifting Flows Over Arbitrary Two-Dimensional Bodies: The Source Panel Method	55
3.4	Lifting Flows over Arbitrary Two-Dimensional Bodies: The Vortex Panel Method	64
3.5	An Application—the Aerodynamics of Drooped Leading-Edge Wings Below and Above Stall	71
4	Mathematical Properties of the Fluid Dynamic Equations	75
4.1	Introduction	75
4.2	Classification of Partial Differential Equations	75
4.3	General Behaviour of the Different Classes of Partial Differential Equations and their Relation to Fluid Dynamics	79
4.3.1	Hyperbolic Equations	79
4.3.2	Parabolic Equations	80
4.3.3	Elliptic Equations	82
4.3.4	Some Comments	83
4.3.5	Well-Posed Problems	84

5	Discretization of Partial Differential Equations	85
5.1	Introduction	85
5.2	Derivation of Elementary Finite Difference Quotients	86
5.3	Basic Aspects of Finite-Difference Equations	92
5.4	Errors and Analysis of Stability	95
6	Transformations and Grids	101
6.1	Introduction	101
6.2	General Transformation of the Equations	103
6.3	Metrics and Jacobians	107
6.4	Coordinate Stretching	109
6.5	Boundary-Fitted Coordinate Systems	113
6.6	Adaptive Grids	118
7	Explicit Finite Difference Methods: Some Selected Applications to Inviscid and Viscous Flows	123
7.1	Introduction	123
7.2	The Lax–Wendroff Method	124
7.3	MacCormack's Method	128
7.4	Stability Criterion	131
7.5	Selected Applications of the Explicit Time-Dependent Technique	132
7.5.1	Non-equilibrium Nozzle Flows	132
7.5.2	Flow Field Over a Supersonic Blunt Body	135
7.5.3	Internal Combustion Engine Flows	137
7.5.4	Supersonic Viscous Flows Over a Rearward-Facing Step With Hydrogen Injection	140
7.5.5	Supersonic Viscous Flow Over a Base	142
7.5.6	Compressible Viscous Flow Over an Airfoil	143
7.6	Final Comment	145
7.7	References (for Chapters 1–7)	145
Part 2		
8	Boundary Layer Equations and Methods of Solution	151
8.1	Introduction	151
8.2	Description of Prandtl's Boundary Layer Equations	152
8.3	Hierarchy of the Boundary Layer Equations	156
8.4	Transformation of the Boundary Layer Equations	160
8.5	Numerical Solution Method	162
8.5.1	Choice of Discretization Model	162
8.5.2	Generalized Crank–Nicholson Scheme	164
8.5.3	Discretization of the Boundary Layer Equation	166
8.5.4	Solution of a Tridiagonal System of Linear Algebraic Equations	170
8.6	Sample Calculations	172
8.6.1	Three-dimensional Boundary Layer Calculation Along Lines of Symmetry	172
8.6.2	Geometrical Conditions	173
8.6.3	Fluid Mechanical Equations	174
8.6.4	Boundary Conditions	175
8.6.5	Solution Scheme	176
8.6.6	Numerical Results	177
8.7	References	178
9	Implicit Time-Dependent Methods for Inviscid and Viscous Compressible Flows, With a Discussion of the Concept of Numerical Dissipation	180
9.1	Introduction	180
9.2	Solution Techniques for Simpler Flows and Reason of Their Failure for Euler/Navier–Stokes Equations	181
9.2.1	Solution Technique for Steady Subsonic Potential Flow	181

9.2.2	Solution Technique for Steady Supersonic Potential Flow	184
9.2.3	More Complicated Problems	184
9.2.4	A Solution: The Time-dependent Approach	186
9.3	Respective Stability Properties of Explicit and Implicit Methods	187
9.3.1	Stability of the Numerical Methods for the Integration of Ordinary Differential Equations	187
9.3.1.1	Definition—Examples	188
9.3.1.2	Weak Instability	189
9.3.1.3	Region of (absolute) Stability	191
9.3.1.4	Stiff Problems	192
9.3.1.5	Absolute Stability	192
9.3.2	Stability of Numerical Methods for the Integration of Partial Differential Equations	194
9.4	Construction of Implicit Methods for Time-dependent Problems	196
9.4.1	Systems of Ordinary Differential Equations: Local Linearization	196
9.4.2	Application of a Linearized Implicit Method to a Nonlinear One-Dimensional PDE	197
9.4.3	Application of a Linearized Implicit Method to a Two-Dimensional PDE-Approximate Factorization	198
9.4.3.1	PDE without Cross Derivative—The Approximate Factorization Technique	198
9.4.3.2	PDE with Cross Derivatives	201
9.4.3.3	Systems of PDEs in Several Space Dimensions—Euler and Navier–Stokes Equations	202
9.4.3.4	Summary of Stability Properties of Linearized Implicit Schemes for PDE	203
9.5	Numerical Dissipation	203
9.5.1	Definition—Need for Dissipation	203
9.5.1.1	Definition	203
9.5.1.2	The Need for Dissipation	205
9.5.1.2.1	The Inherent Limitation of Numerical Methods	205
9.5.1.2.2	Instances in which Dissipation is Needed: Inherent Inadequacy of the Mesh	206
9.5.1.2.3	Time-wise Dissipation and Steady-state Dissipation	209
9.5.2	The Various Ways of Generating Dissipation	211
9.5.2.1	Artificial Viscosity	211
9.5.2.2	Dissipation Through Time-Differencing	212
9.5.2.2.1	Dissipation of the Time Integrator Itself	212
9.5.2.2.2	Simultaneous Time and Space Discretization	212
9.5.2.3	Upwind Differencing	214
9.6	Conservative Upwind Discretization for Hyperbolic Systems—Further Advantages of Upwind Discretization	216
9.6.1	Conservative Upwind Discretization for Systems	216
9.6.1.1	Roe's Flux Difference Splitting Scheme	216
9.6.1.2	Steger and Warming's Flux Vector Splitting Scheme	219
9.6.2	Further Advantages of Upwind Differencing	220
9.7	Conclusion	221
9.8	References	221
10	Introduction to Finite Element Techniques in Computational Fluid Dynamics	223
10.1	Introduction	223
10.2	Strong and Weak Formulations of a Boundary Value Problem	225
10.2.1	Strong Formulation	225
10.2.2	Weighted Residual Formulation	228
10.2.3	Galerkin Formulation	229
10.2.4	Weak Formulation	230
10.2.5	Variational Formulation	232
10.2.6	Conclusion	232
10.3	Piecewise Defined Shape Functions	233
10.3.1	The Finite Element Interpolation	233

10.3.2	Finite Elements with C_0 Continuity in Two-dimensions	237
10.3.2.1	Triangular Elements	237
10.3.2.2	Quadrilateral Lagrange Elements	241
10.3.2.3	Quadrilateral Serendipity Elements	241
10.3.2.4	Isoparametric Elements	242
10.3.3	Finite Elements with C_1 Continuity	243
10.4	Implementation of the Finite Element Method	244
10.4.1	The Assembly	244
10.4.2	Numerical Integration	245
10.4.3	Solution Procedure	246
10.5	Examples	246
10.5.1	Steady Incompressible Potential Flow	247
10.5.2	Incompressible Navier–Stokes Equations in $\omega - \psi$ Formulation	249
10.5.3	Incompressible Steady Navier–Stokes Equations in u, v, p Formulation	254
10.5.4	Compressible Euler Equations	257
10.6	References	259
11	Introduction to Finite Volume Techniques in Computational Fluid Dynamics	261
11.1	Introduction	261
11.2	FEM-like Finite Volume Techniques	265
11.2.1	Cell-centred Formulation	266
11.2.1.1	Lax–Wendroff Time Stepping	267
11.2.1.2	Runge–Kutta Time Stepping—Multi-stage Time Stepping	272
11.2.1.3	Accuracy	277
11.2.2	Cell-vertex Formulation	277
11.2.2.1	Multi-stage Time Stepping—Overlapping Control Volumes	277
11.2.2.2	Lax–Wendroff Time Stepping—Non-overlapping Control Volumes	279
11.3	FDM-like Finite Volume Techniques	280
11.3.1	Central Type Discretizations	281
11.3.2	Upwind Type Discretizations	281
11.4	Other Formulations	286
11.5	Treatment of Derivatives	286
11.6	References	287
	Subject Index	289
