

Contents

A Stochastic Primer

By **J.R. Klauder**

1	Random Variables	1
2	Stochastic Variables	12
3	Stochastic Differential Equations, a.k.a. Langevin Equations	29
	References	42

Computer Assisted Proofs

By **O.E. Lanford III** (with 1 figure)

1	Introduction	43
2	Floating Point Computation and Round-off Error	44
3	Problems with Interval Arithmetic	46
4	The Feigenbaum Problem	50
5	Other Applications	57
	References	58

Finite Size Effects at Phase Transitions

By **K. Binder** (with 30 figures)

1	Introduction	59
2	Finite Size Effects and the Percolation Problem	62
3	Finite Size Effects at Thermal Second Order Phase Transitions	67
4	The Order Parameter Probability Distribution in Finite Systems	79
5	Finite Size Rounding of Critical Slowing Down	90
6	Finite Size Scaling without Hyperscaling	95

7	Finite Size Scaling for First Order Phase Transitions	98
8	Finite Size Effects in Anisotropic Geometries and for Anisotropic Critical Behavior	108
9	Crossover Scaling from One Universality Class to Another	116
10	Concluding Remarks	120
	References	120

High Precision Simulations With Fast Algorithms

By U. Wolff (with 11 figures)

1	Introduction	127
2	Monte Carlo Evaluation of Path Integrals	128
3	Overrelaxation	133
4	Cluster Algorithm and $O(3)$ σ -Model Results	142
5	Outlook	156
	References	157

The Present and Future of Lattice QCD

By T. DeGrand (with 29 figures)

1	Introduction	159
2	Beginnings	159
3	Lattice Spectroscopy	169
4	QCD at Nonzero Temperature	184
5	Matrix Elements – A Case Study	193
6	The Future of Lattice QCD?	200
	References	201

Effective Field Theories

By G. Mack, T. Kalkreuter, G. Palma
and M. Speh (with 9 figures)

1	What are Effective Field Theories?	205
2	The Constraint Effective Potential	212
3	Renormalization Group Picture	212

4	Computation of Effective Actions by Perturbation Theory (Loop Expansion)	215
5	Averaging and Interpolation Kernels C and A in the Presence of Gauge Fields, for Bosons	221
6	Effective Potential for a Higgs Model with Dynamical Gauge Fields	223
7	Blockspin for Fermions	226
8	Efficient Computation of Gauge Covariant Propagators	232
9	Neural Optimization of Deterministic Multigrids	239
10	Blocked Gauge Fields	243
11	Simulation Methods for the Computation of Effective Actions	244
	References	247

Computers in the Design and Analysis of HEP Experiments

By F. James (with 5 figures)

1	Summary	251
2	Accelerator Studies	251
3	LEP Experiments at CERN	253
4	Software Engineering	253
5	Event Visualization	257
6	Detector Description Data Bases	261
7	Monte Carlo Simulation	263
8	Quasi-Monte Carlo	264
	References	271
	Seminars	273
