

Table of Contents

CHAPTER I : NON COMMUTATIVE PROBABILITY

1. Basic definitions	1
Random variables and states in a complex algebra (1). An example (2). Unitary groups (3). Von Neumann's axiomatization (4). Selfadjoint operators and Stone's theorem (5). Criteria for selfadjointness : Nelson's analytic vectors theorem (6). Spectral measures and integrals (7). Spectral representation of s.a. operators (8). Elementary quantum mechanics (9). Quantization of a probabilistic situation (10).	

CHAPTER II : SPIN

1. Two level systems	11
Two dimensional Hilbert space (1). Description of all states and observables (2). Creation and annihilation operators (3). Elementary Weyl operators (4).	
2. Commuting spin systems	14
Commuting spins and toy Fock space (1). Creation and annihilation operators (2). Representation of all operators on toy Fock space (3). Adapted operators (4). The three basic "martingales" and predictable representation (5). Discrete coherent vectors (6)	
3. A de Moivre-Laplace theorem	19
Preliminary computations (1). Convergence to the harmonic oscillator creation/annihilation pair (2). Including the number operator (3).	
4. Angular momentum	25
Angular momentum commutation relations (1). Structure of irreducible representations (2). Additional results (3). Addition of angular momenta (4). Structure of the Bernoulli case (5). A commutative process of spins (6).	
5. Anticommuting spin systems	34
Fermion creation/annihilation operators (1). Jordan-Wigner transformation on toy Fock space (2). Some computations (3). Clifford algebras (4-5). Basis free definition (6). Grassmann and Wick product (7). Linear spaces of Bernoulli r.v.'s (8). Automorphisms of the Clifford structure (9). Integrals (10).	

CHAPTER III : THE HARMONIC OSCILLATOR

1. Schrödinger's model	41
The canonical commutation relation (1). Schrödinger's model (2). Weyl's commutation relations (3). Gaussian states of the canonical pair (4). Uncertainty relations and minimal uncertainty (5). Uniqueness of the Weyl commutation relation : the Stone-von Neumann theorem (6-7). Application to the Plancherel theorem (8). Application to reducible canonical pairs and general gaussian laws (9).	
2. Creation and annihilation operators	49
Dirac's approach for the harmonic oscillator (1). The real gaussian model of the canonical pair (2). Eigenvectors of the harmonic oscillator (3). Weyl operators and coherent vectors (4). The complex gaussian model (5). Classical states (6).	

CHAPTER IV : FOCK SPACE (1)

1. Basic definitions 55

Symmetric and antisymmetric tensor products, norms, bases (1). Boson and fermion Fock spaces (2). Exponential or coherent vectors (3). Creation and annihilation operators (4). Canonical commutation (CCR) and anticommutation (CAR) relations (5). Second quantization of an operator (6). Some useful formulas (7). Creation/annihilation operators on the full Fock space (8). Weyl operators (9). A computation of generators (10). Exponentials of simple operators (11).

2. Fock space and multiple integrals 66

Wiener–Ito multiple integrals (1). Extensions : square integrable martingales and the chaotic representation property (2 a)), the symmetric description (2 b)) and the “shorthand notation” (2 c)). Interpretation of exponential vectors (3) and of the operators P_t, Q_t . The number operator and the Ornstein–Uhlenbeck semigroup (4). Compensated Poisson processes as processes of operators on Fock space (5). The Ito integral in Fock space language (6).

3. Multiplication formulas 75

The Wiener multiplication formula : classical form (1) and shorthand form (2). Maassen’s sum/integral lemma, associativity, Wick and other products (3). Gaussian computations (4–5). The Poisson multiplication formula (6). Relation with toy Fock space (7). Grassmann and Clifford multiplications (8). Fermion brownian motion (9).

4. Maassen’s kernels 87

Kernels with two and three arguments (1). Examples of kernels (2). Composition of kernels (3). Kernel computation on Gaussian spaces (4). The algebra of regular kernels : Maassen’s theorem (5). Fermion kernels (6). The Jordan–Wigner transformation (7).

CHAPTER V. MULTIPLE FOCK SPACES

1. Multidimensional stochastic integrals 97

Fock space over $L^2(\mathbb{R}_+, K)$, multiple integrals, shorthand notation (1). Some product formulas (2). Some non–Fock representations of the CCR (3), their Weyl operators (4), Ito table and multiplication formula (5).

2. Number and exchange operators 105

Exchange operators, Evans’ notation (1). Kernels on multiple Fock space (2). Composition of kernels (3). Uniqueness of kernel representations (4). Operator valued kernels (5). Parthasarathy’s construction of Lévy processes (6).

3. Basis free notation in multiple Fock space 114

Imitating simple Fock space (1). Belavkin’s notation (2). Another approach to kernels (2).

CHAPTER VI. STOCHASTIC CALCULUS ON FOCK SPACE

1. Operator stochastic integrals 117

Initial space, adapted operators (1). Integration of an adapted process, informal description, simple Fock space (2–4). Computation on exponential vectors (5). Basic inequalities (6–7). Extension to multiple Fock spaces (8). The general formulas (9). Uniqueness of the representation as stochastic integrals (10). Shift operators on Fock space (11). Cocycles (12). Some examples (13).

2. Stochastic calculus with kernels 137

Algebraic stochastic integration : the Skorohod integral (1). Extension to kernels : regular and smooth processes (2). Another definition of the stochastic integral (3).

3. Stochastic differential equations and flows.....	141
Formal study : Right and left exponential equations (1). The Picard method (2). Conditions for isometry and unitarity (3). Generator of the evolution of operators (4). Translation of the classical s.d.e. theory into algebraic language (5). Discrete flows (6). The algebra of structure equations (7). Discrete Markov chains as quantum flows (8-10). Continuous finite Markov chains as quantum flows (11).	
4. S.d.e.'s and flows : some rigorous results	163
The right equation with infinite multiplicity and bounded coefficients (1). The Mohari-Sinha conditions (2). Introduction to the unbounded case (3). Contractivity condition (4). A functional analytic lemma (5). The right equation as a multiplicative integral (6-8). Time reversal (9) and relation between the right and left equations (10). Existence of quantum flows : infinite multiplicity and bounded coefficients (11-12). The homomorphism property (13). Contractivity (14). A simple uniqueness result (15). The case of an abelian initial algebra (16). Mohari's uniqueness theorem (17). A sketch of Fagnola's existence theorem (18).	

CHAPTER VII. INDEPENDENCE

§1. Coalgebras and bialgebras	187
Definition of coalgebras and bialgebras (1). Examples (2). Convolution of linear functionals (3). The fundamental theorem on coalgebras (4). Processes with independent increments (5). Generators of convolution semigroups and Schürmann triples (6). The Schürmann triple of a Lévy process (7). Relation with Belavkin's notation (8).	
§2. Construction of the process	196
Construction on a coalgebra (1). The bialgebra case (2). Application to Azéma martingales (3). Conditionally positive functions on semi-groups (4-5)	

APPENDIX 1 : FUNCTIONAL ANALYSIS..... 201

Hilbert-Schmidt operators (1). Trace class operators (2). Duality properties (3) Weak convergence properties (4). Weak topologies for operators (5). Tensor products of Hilbert spaces (6-7).

APPENDIX 2 : CONDITIONING AND KERNELS..... 211

Conditioning : discrete case (1). Conditioning : continuous case (2). Example of the canonical pair (3). Multiplicity theory (4). Classical kernels (5). Non commutative kernels, first form (6), second form (7). Completely positive maps (8). Some difficulties (9).

APPENDIX 3 : TWO EVENTS 221

APPENDIX 4 : C^* -ALGEBRAS

1. Elementary theory..... 225

Definition of C^* -algebras (1). Application of spectral theory (2). Some elementary properties (3). Positive elements (4). Symbolic calculus for s.a. elements (5). Applications (6). Characterization of positive elements (7). A few inequalities (8).

2. States on C^* -algebras..... 230

Existence of many states (1). Representations and the GNS theorem (2-3). Examples from toy Fock space theory (4). Quotient algebras and approximate units (5).

3. Von Neumann algebras	234
Weak topologies and normal states (1). Von Neumann's bicommutant theorem (2-3). Kaplanski's density theorem (4). The predual (5). Normality and order continuity (6). About integration theory (7). Measures with bounded density (8). The linear Radon-Nikodym theorem (9). The KMS condition (10). Entire vectors (11).	
4. The Tomita-Takesaki theory	245
Elementary geometric properties (1). The main operators (2-3). Interpretation of the adjoint (4). The modular property (5). Using the linear RN theorem (6). The main computation (7). The three main theorems (8). Additional results (9). Examples (10).	
APPENDIX 5 : LOCAL TIMES AND FOCK SPACE	
1. Dynkin's formula	255
Symmetric Markov semigroups and processes (1). Dynkin's formula (2). Sketch of the Marcus-Rosen approach to the continuity of local times (3).	
2. Le Jan's "supersymmetric" approach	260
Notations of complex Brownian motion (1). Computing the Wiener product (2). Extension to other bilinear forms (ξ -products) (3). Stratonovich integral and trace (4). Expectation of the exponential of an element of the second chaos (5). Return to Clifford algebra : antisymmetric ξ -products (6). Exponential formula in the antisymmetric case (7). Supersymmetric Fock space : the Wick and Wiener products (8). Properties of the Wiener product (9). Applications to local times (sketch) (10). Proof of associativity of the ξ -product (11).
