|                                                                                          |     |
|------------------------------------------------------------------------------------------|-----|
| Foreword . . . . .                                                                       | IX  |
| Opening Address                                                                          |     |
| <i>T. Dracos</i> . . . . .                                                               | 1   |
| Session One. Chairman T. Dracos                                                          |     |
| Similarity Laws for Wall Turbulent Flows: Their Limitations and Generalizations          |     |
| <i>A.M. Yaglom</i> . . . . .                                                             | 7   |
| A Prediction of the Multifractal Model: The Intermediate Dissipation Range               |     |
| <i>U. Frisch and M. Vergassola</i> . . . . .                                             | 29  |
| A New View of Developed Turbulence                                                       |     |
| <i>B. Castaing and Y. Gagne, E. J. Hopfinger</i> . . . . .                               | 35  |
| Discussion . . . . .                                                                     | 47  |
| Session Two. Chairman H. K. Moffatt                                                      |     |
| On Vortices And Cascades in Turbulence                                                   |     |
| <i>M. Lesieur, O. Métais and P. Comte</i> . . . . .                                      | 61  |
| A Dynamical Theory of Cascade in Turbulence and Non-Gaussian Statistics                  |     |
| <i>T. Kambe</i> . . . . .                                                                | 79  |
| Small Scale Vortices in Turbulent Flows                                                  |     |
| <i>J. Jiménez</i> . . . . .                                                              | 95  |
| Discussion . . . . .                                                                     | 111 |
| Session Three. Chairman H. Aref                                                          |     |
| Spiral Structures in Turbulent Flow                                                      |     |
| <i>H.K. Moffatt</i> . . . . .                                                            | 121 |
| Solutions of Exact Kinetic Equations for Intermittent Turbulence                         |     |
| <i>E.A. Novikov</i> . . . . .                                                            | 131 |
| How Important are Direct Interactions between Large and Small Scales in Turbulent Flows? |     |
| <i>A. Tsinober</i> . . . . .                                                             | 141 |
| Discussion . . . . .                                                                     | 151 |

|                                                                                       |     |
|---------------------------------------------------------------------------------------|-----|
| Session Four. Chairman M. Lesieur                                                     |     |
| How Long is the Way from Chaos to Turbulence?                                         |     |
| <i>G.M. Zaslavsky</i>                                                                 | 165 |
| Vortex Interactions as a Dynamical System                                             |     |
| <i>H. Aref and I. Zawadzki</i>                                                        | 191 |
| Finite-dimensional Dynamics and Chaos in Fluid Flows                                  |     |
| <i>T. Mullin</i>                                                                      | 207 |
| Discussion                                                                            | 221 |
| Session Five. Chairman J. R. Herring                                                  |     |
| The Origins of Turbulence                                                             |     |
| <i>M. Gaster</i>                                                                      | 235 |
| Role of Algebraic Instability in Transition and Turbulence                            |     |
| <i>M.T. Landahl</i>                                                                   | 251 |
| Active Control of Skin Friction and Separation in Certain Class of Wall-Bounded Flows |     |
| <i>I. Wygnanski</i>                                                                   | 265 |
| Rapid Distortion Theory and the Structure of Turbulence                               |     |
| <i>J. Hunt and N. Kevlahan</i>                                                        | 285 |
| Discussion                                                                            | 317 |
| Session Six. Chairman J. Jiménez                                                      |     |
| A New Approach for Large Eddy Simulation of Turbulence and Scalar Transport           |     |
| <i>P. Moin</i>                                                                        | 331 |
| On the Contribution of Multi-Point Experimental Techniques to the Study of Turbulence |     |
| <i>R.J. Adrian</i>                                                                    | 341 |
| Direct Numerical Simulations and Hot Wire Experiments: A Possible Way Ahead?          |     |
| <i>R.A. Antonia</i>                                                                   | 349 |
| Small-Scale Structures in Turbulence: Their Implications for Turbulence Closures      |     |
| <i>J. R. Herring and R.M. Kerr</i>                                                    | 367 |
| A Note on Local Isotropy in High-Reynolds-Number Turbulence                           |     |
| <i>S.V. Veeravalli, S.G. Saddoughi, A.A. Praskovsky and P. Bradshaw</i>               | 377 |
| Discussion                                                                            | 385 |

## Group Work

Group I: Prospects of physical and numerical experiments for the fundamental understanding of turbulence

*Chairman R.J. Adrian* . . . . . 395

Group II: Future implications of chaos theory, dynamical systems and prospects of low-dimensional descriptions of turbulent flows

*Chairman H. Aref* . . . . . 399

Group III: Reduction of non-linearity in turbulent flows – further lines of research and their use in the development of the theory of turbulence

*Chairman H.K. Moffatt* . . . . . 402

Group IV: Prospects of statistical approaches to the turbulence problem – how statistical methods, e.g. the theory of random fields, should be used in view of recent developments regarding the structure of turbulence, dynamical chaos, strange attractors, fractals

*Chairman E.A. Novikov* . . . . . 405

## Summary of the Symposium

*W.C. Reynolds and U. Frisch* . . . . . 413

Discussion . . . . . 421
