

Josef Honerkamp Hartmann Römer

Theoretical Physics

A Classical Approach

Translated by H. Pollack

With 141 Figures and 39 Problems

Springer-Verlag

Berlin Heidelberg New York

London Paris Tokyo

Hong Kong Barcelona

Budapest

Contents

1. Introduction	1
2. Newtonian Mechanics	5
2.1 Space and Time in Classical Mechanics	5
2.2 Newton's Laws	11
2.3 A Few Important Force Laws	15
2.4 The Energy of a Particle in a Force Field	21
2.4.1 Line Integrals	21
2.4.2 Work and Energy	25
2.5 Several Interacting Particles	29
2.6 Momentum and Momentum Conservation	34
2.7 Angular Momentum	41
2.8 The Two-Body Problem	44
2.9 The Kepler Problem	51
2.10 Scattering	59
2.10.1 Relative Motion in the Scattering Process	60
2.10.2 The Center of Mass System and the Laboratory System	64
2.11 The Scattering Cross-Section	71
2.12 The Virial Theorem	76
2.13 Mechanical Similarity	79
2.14 Some General Observations About the Many-Body Problem ..	81
Problems	83
3. Lagrangian Methods in Classical Mechanics	87
3.1 A Sketch of the Problem and Its Solution in the Case of a Pendulum	87
3.2 The Lagrangian Method of the First Type	89
3.3 The Lagrangian Method of the Second Type	97
3.4 The Conservation of Energy in Motions Which are Limited by Constraints	104
3.5 Non-holonomic Constraints	112
3.6 Invariants and Conservation Laws	117
3.7 The Hamiltonian	123
3.7.1 Lagrange's Equations and Hamilton's Equations	123

3.7.2	Aside on the Further Development of Theoretical Mechanics and the Theory of Dynamical Systems	128
3.8	The Hamiltonian Principle of Stationary Action	133
3.8.1	Functionals and Functional Derivatives	133
3.8.2	Hamilton's Principle	137
3.8.3	Hamilton's Principle for Systems with Holonomic Constraints	139
	Problems	141
4.	Rigid Bodies	145
4.1	The Kinematics of the Rigid Body.	145
4.2	The Inertia Tensor and the Kinetic Energy of a Rigid Body. .	152
4.2.1	Definition and Elementary Properties of the Inertia Tensor	152
4.2.2	Calculation of Inertia Tensors.	157
4.3	The Angular Momentum of a Rigid Body, Euler's Equations. .	160
4.4	The Equations of Motion for the Eulerian Angles.	167
	Problems	176
5.	Motion in a Noninertial System of Reference	179
5.1	Fictitious Forces in Noninertial Systems.	179
5.2	Foucault's Pendulum.	184
6.	Linear Oscillations	189
6.1	Linear Approximations About a Point of Equilibrium	190
6.2	A Few General Remarks About Linear Differential Equations. .	192
6.3	Homogeneous Linear Systems with One Degree of Freedom and Constant Coefficients	196
6.4	Homogeneous Linear Systems with n Degrees of Freedom and Constant Coefficients	200
6.4.1	Normal Modes and Eigenfrequencies	200
6.4.2	Examples of the Calculation of Normal Modes	204
6.5	The Response of Linear Systems to External Forces.	211
6.5.1	External Oscillating Forces.	211
6.5.2	Superposition of External Harmonic Forces.	214
6.5.3	Periodic External Forces.	215
6.5.4	Arbitrary External Forces.	216
	Problems	218
7.	Classical Statistical Mechanics	223
7.1	Thermodynamic Systems and Distribution Functions.	224
7.2	Entropy	229
7.3	Temperature, Pressure, and Chemical Potential	233
7.3.1	Systems with Exchange of Energy.	234
7.3.2	Systems with an Exchange of Volume.	238
7.3.3	Systems with Exchanges of Energy and Particles	239

7.4	The Gibbs Equation and the Forms of Energy Exchange	241
7.5	The Canonical Ensemble and the Free Energy	245
7.6	Thermodynamic Potentials	252
7.7	Material Constants	256
7.8	Changes of State	260
7.8.1	Reversible and Irreversible Processes	260
7.8.2	Adiabatic and Non-adiabatic Processes	264
7.8.3	The Joule–Thomson Process.	269
7.9	The Transformation of Heat into Work, the Carnot Efficiency	271
7.10	The Laws of Thermodynamics.	278
7.11	The Phenomenological Basis of Thermodynamics.	282
7.11.1	Thermodynamics and Statistical Mechanics	282
7.11.2	The First Law of Thermodynamics	284
7.11.3	The Second and Third Laws.	285
7.11.4	The Thermal and Caloric Equations of State	289
7.12	Equilibrium and Stability Conditions	292
7.12.1	Equilibrium and Stability in Exchange Processes	292
7.12.2	Equilibrium, Stability and Thermodynamic Potentials	296
	Problems	301
8.	Applications of Thermodynamics	305
8.1	Phase Transformations and Phase Diagrams	306
8.2	The Latent Heat of Phase Transitions.	309
8.3	Solutions	317
8.4	Henry's Law, Osmosis.	320
8.4.1	Henry's Law	321
8.4.2	Osmosis.	322
8.5	Phase Transitions in Solutions	325
8.5.1	Case (2): Miscibility in Only One Phase	325
8.5.2	Case (3): Miscibility in Two Phases.	330
	Problem.	331
9.	Elements of Fluid Mechanics	333
9.1	A Few Introductory Remarks About Fluid Mechanics	333
9.2	The General Balance Equation	337
9.3	Particular Balance Equations	341
9.4	Entropy Production, Generalized Forces, and Fluids	348
9.5	The Differential Equations of Fluid Mechanics.	354
9.6	A Few Elementary Applications of the Navier–Stokes Equations	359
	Problem.	365
10.	The Most Important Linear Partial Differential Equations of Physics	367
10.1	General Considerations	367
10.1.1	Types of Linear Partial Differential Equations, the Formulation of Boundary and Initial Value Problems.	367

10.1.2 Initial Value Problems in \mathbb{R}^D	371
10.1.3 Inhomogeneous Equations and Green's Functions	374
10.2 Solutions of the Wave Equation	376
10.3 Boundary Value Problems.	380
10.3.1 Initial Observations.	380
10.3.2 Examples of Boundary Value Problems	381
10.3.3 The General Treatment of Boundary Value Problems	386
10.4 The Helmholtz Equation in Spherical Coordinates, Spherical Harmonics, and Bessel Functions.	388
10.4.1 Separation of Variables.	389
10.4.2 The Angular Equations, Spherical Harmonics	390
10.4.3 The Radial Equation, Bessel Functions.	395
10.4.4 Solutions of the Helmholtz Equation	398
10.4.5 Supplementary Considerations	399
Problems	401
11. Electrostatics	405
11.1 The Basic Equations of Electrostatics and Their First Consequences	405
11.1.1 Coulomb's Law and the Electric Field	405
11.1.2 Electrostatic Potential and the Poisson Equation.	407
11.1.3 Examples and Important Properties of Electrostatic Fields	410
11.2 Boundary Value Problems in Electrostatics, Green's Functions	413
11.2.1 Dirichlet and Neumann Green's Functions.	413
11.2.2 Supplementary Remarks on Boundary Value Problems in Electrostatics.	417
11.3 The Calculation of Green's Functions, the Method of Images	420
11.4 The Calculation of Green's Functions, Expansion in Spherical Harmonics	427
11.5 Localized Charge Distributions, the Multipole Expansion	431
11.6 Electrostatic Potential Energy	434
Problems	437
12. Moving Charges, Magnetostatics	439
12.1 The Biot-Savart Law, the Fundamental Equations of Magnetostatics.	439
12.1.1 Electric Current Density and Magnetic Fields	439
12.1.2 The Vector Potential and Ampère's Law	443
12.1.3 The SI-System of Units in Electrodynamics	446
12.2 Localized Current Distributions	447
12.2.1 The Magnetic Dipole Moment	447
12.2.2 Force, Potential, and Torque in a Magnetic Field	450

13. Time Dependent Electromagnetic Fields	455
13.1 Maxwell's Equations	455
13.2 Potentials and Gauge Transformations	458
13.3 Electromagnetic Waves in a Vacuum, the Polarization of Transverse Waves	461
13.4 Electromagnetic Waves, the Influence of Sources	464
13.5 The Energy of the Electromagnetic Field.	469
13.5.1 Balance of Energy and the Poynting Vector.	469
13.5.2 The Energy Flux of the Radiation Field	472
13.5.3 The Energy of the Electric Field	474
13.5.4 The Energy of the Magnetic Field	476
13.5.5 Self-Energy and Interaction Energy	478
13.6 The Momentum of the Electromagnetic Field	480
14. Elements of the Electrodynamics of Continuous Media	483
14.1 The Macroscopic Maxwell Equations	483
14.1.1 Microscopic and Macroscopic Fields	483
14.1.2 The Average Charge Density and Electric Displacement	485
14.1.3 The Average Current Density and the Magnetic Field Strength	488
14.2 Electrostatic Fields in Continuous Media	491
14.3 Magnetostatic Fields in Continuous Media.	496
14.4 Plane Waves in Matter, Wave Packets	499
14.4.1 The Frequency Dependence of Susceptibility	500
14.4.2 Wave Packets, Phase and Group Velocity	503
14.5 Reflection and Refraction at Plane Boundary Surfaces	508
14.5.1 Boundary Conditions, the Laws of Reflection and Refraction	508
14.5.2 Fresnel's Equations	510
14.5.3 Special Effects of Reflection and Refraction	513
Appendices	517
A. The Γ -Function	517
B. Conic Sections	519
C. Tensors	522
D. Fourier Series and Fourier Integrals	526
D.1 Fourier Series	526
D.2 Fourier Integrals and Fourier Transforms	532
E. Distributions and Green's Functions	536
E.1 Distributions	536
E.2 Green's Functions	541
F. Vector Analysis and Curvilinear Coordinates	543
F.1 Vector Fields and Scalar Fields	544
F.2 Line, Surface, and Volume Integrals	544

F.3	Stokes's Theorem	547
F.4	Gauss's Theorem.....	548
F.5	Applications of the Integral Theorems	550
F.6	Curvilinear Coordinates	551
Problems	555
References	557
Subject Index	561
