

CONTENTS

I. Introductory Remarks.....	1
§1. General Information about the Variety of Solutions.....	2
1. Examples.....	2
2. Differential Equations for Given Families of Functions.....	8
§2. Systems of Differential Equations.....	12
1. The Question of Equivalence of a System of Differential Equations and a Single Differential Equation.....	12
2. Elimination from a Linear System with Constant Coefficients.....	14
3. Determined, Overdetermined, Underdetermined Systems...	15
§3. Methods of Integration for Special Differential Equations.....	18
1. Separation of Variables.....	18
2. Construction of Further Solutions by Superposition. Fundamental Solution of the Heat Equation. Poisson's Integral...	20
§4. Geometric Interpretation of a First Order Partial Differential Equation in Two Independent Variables. The Complete Integral.....	22
1. Geometric Interpretation of a First Order Partial Differential Equation.....	22
2. The Complete Integral.....	24
3. Singular Integrals.....	25
4. Examples.....	27
§5. Theory of Linear and Quasi-Linear Differential Equations of First Order.....	28
1. Linear Differential Equations.....	28
2. Quasi-Linear Differential Equations.....	31
§6. The Legendre Transformation.....	32
1. The Legendre Transformation for Functions of Two Variables.....	32
2. The Legendre Transformation for Functions of n Variables...	34
3. Application of the Legendre Transformation to Partial Differential Equations.....	35
§7. The Existence Theorem of Cauchy and Kowalewsky.....	39
1. Introduction and Examples.....	39
2. Reduction to a System of Quasi-Linear Differential Equations.....	43
3. Determination of Derivatives Along the Initial Manifold...	47
4. Existence Proof for Solutions of Analytic Differential Equations.....	48
4a. Observation About Linear Differential Equations.....	54

4b. Remark About Nonanalytic Differential Equations.....	54
5. Remarks on Critical Initial Data. Characteristics.....	55
<i>Appendix 1 to Chapter I. Laplace's Differential Equation for the Support Function of a Minimal Surface.....</i>	<i>56</i>
<i>Appendix 2 to Chapter I. Systems of Differential Equations of First Order and Differential Equations of Higher Order.....</i>	<i>58</i>
1. Plausibility Considerations.....	58
2. Conditions of Equivalence for Systems of Two First Order Partial Differential Equations and a Differential Equation of Second Order.....	58
II. General Theory of Partial Differential Equations of First Order...	62
§1. Geometric Theory of Quasi-Linear Differential Equations in Two Independent Variables.....	62
1. Characteristic Curves.....	62
2. Initial Value Problem.....	64
3. Examples.....	66
§2. Quasi-Linear Differential Equations in n Independent Variables..	69
§3. General Differential Equations in Two Independent Variables... 75	75
1. Characteristic Curves and Focal Curves. The Monge Cone... 75	75
2. Solution of the Initial Value Problem.....	79
3. Characteristics as Branch Elements. Supplementary Remarks. Integral Conoid. Caustics.....	82
§4. The Complete Integral.....	84
§5. Focal Curves and the Monge Equation.....	86
§6. Examples.....	88
1. The Differential Equation of Straight Light Rays, $(\text{grad } u)^2 = 1$	88
2. The Equation $F(u_x, u_y) = 0$	91
3. Clairaut's Differential Equation.....	94
4. Differential Equation of Tubular Surfaces.....	95
5. Homogeneity Relation.....	96
§7. General Differential Equation in n Independent Variables.....	97
§8. Complete Integral and Hamilton-Jacobi Theory.....	103
1. Construction of Envelopes and Characteristic Curves.....	103
2. Canonical Form of the Characteristic Differential Equations..	106
3. Hamilton-Jacobi Theory.....	107
4. Example. The Two-Body Problem.....	109
5. Example. Geodesics on an Ellipsoid.....	111
§9. Hamilton-Jacobi Theory and the Calculus of Variations.....	113
1. Euler's Differential Equations in Canonical Form.....	114
2. Geodetic Distance or Eiconal and Its Derivatives. Hamilton- Jacobi Partial Differential Equation.....	115
3. Homogeneous Integrands.....	119
4. Fields of Extremals. Hamilton-Jacobi Differential Equation..	121
5. Cone of Rays. Huyghens' Construction.....	124

6. Hilbert's Invariant Integral for the Representation of the Eiconal.....	125
7. Theorem of Hamilton and Jacobi.....	127
§10. Canonical Transformations and Applications.....	127
1. The Canonical Transformation.....	127
2. New Proof of the Hamilton-Jacobi Theorem.....	129
3. Variation of Constants (Canonical Perturbation Theory)....	130
<i>Appendix 1 to Chapter II</i>	132
§1. Further Discussion of Characteristic Manifolds.....	132
1. Remarks on Differentiation in n Dimensions.....	132
2. Initial Value Problem. Characteristic Manifolds.....	135
§2. Systems of Quasi-Linear Differential Equations with the Same Principal Part. New Derivation of the Theory.....	139
§3. Haar's Uniqueness Proof.....	145
<i>Appendix 2 to Chapter II. Theory of Conservation Laws</i>	147
III. Differential Equations of Higher Order	154
§1. Normal Forms for Linear and Quasi-Linear Differential Operators of Second Order in Two Independent Variables.....	154
1. Elliptic, Hyperbolic, and Parabolic Normal Forms. Mixed Types.....	155
2. Examples.....	160
3. Normal Forms for Quasi-Linear Second Order Differential Equations in Two Variables.....	163
4. Example. Minimal Surfaces.....	167
5. Systems of Two Differential Equations of First Order.....	169
§2. Classification in General and Characteristics.....	170
1. Notations.....	170
2. Systems of First Order with Two Independent Variables. Characteristics.....	171
3. Systems of First Order with n Independent Variables.....	173
4. Differential Equations of Higher Order. Hyperbolicity.....	175
5. Supplementary Remarks.....	176
6. Examples. Maxwell's and Dirac's Equations.....	176
§3. Linear Differential Equations with Constant Coefficients.....	180
1. Normal Form and Classification for Equations of Second Order.....	181
2. Fundamental Solutions for Equations of Second Order.....	184
3. Plane Waves.....	187
4. Plane Waves Continued. Progressing Waves. Dispersion....	188
5. Examples. Telegraph Equation. Undistorted Waves in Cables.....	192
6. Cylindrical and Spherical Waves.....	193
§4. Initial Value Problems. Radiation Problems for the Wave Equation.....	197
1. Initial Value Problems for Heat Conduction. Transformation of the Theta Function.....	197

2. Initial Value Problems for the Wave Equation.....	201
3. Duhamel's Principle. Nonhomogeneous Equations. Retarded Potentials.....	202
3a. Duhamel's Principle for Systems of First Order.....	204
4. Initial Value Problem for the Wave Equation in Two-Dimensional Space. Method of Descent.....	205
5. The Radiation Problem.....	206
6. Propagation Phenomena and Huyghens' Principle.....	208
§5. Solution of Initial Value Problems by Fourier Integrals.....	210
1. Cauchy's Method of the Fourier Integral.....	210
2. Example.....	212
3. Justification of Cauchy's Method.....	215
§6. Typical Problems in Differential Equations of Mathematical Physics.....	221
1. Introductory Remarks.....	221
2. Basic Principles.....	226
3. Remarks about "Improperly Posed" Problems.....	230
4. General Remarks About Linear Problems.....	231
<i>Appendix 1 to Chapter III.....</i>	<i>232</i>
§1. Sobolev's Lemma.....	232
§2. Adjoint Operators.....	234
1. Matrix Operators.....	234
2. Adjoint Differential Operators.....	235
<i>Appendix 2 to Chapter III. The Uniqueness Theorem of Holmgren....</i>	<i>237</i>
IV. Potential Theory and Elliptic Differential Equations.....	240
§1. Basic Notions.....	240
1. Equations of Laplace and Poisson, and Related Equations... ..	240
2. Potentials of Mass Distributions.....	245
3. Green's Formulas and Applications.....	252
4. Derivatives of Potentials of Mass Distributions.....	258
§2. Poisson's Integral and Applications.....	261
1. The Boundary Value Problem and Green's Function.....	261
2. Green's Function for the Circle and Sphere. Poisson's Integral for the Sphere and Half-Space.....	264
3. Consequences of Poisson's Formula.....	268
§3. The Mean Value Theorem and Applications.....	275
1. The Homogeneous and Nonhomogeneous Mean Value Equation.....	275
2. The Converse of the Mean Value Theorems.....	277
3. Poisson's Equation for Potentials of Spatial Distributions... ..	284
4. Mean Value Theorems for Other Elliptic Differential Equations.....	286
§4. The Boundary Value Problem.....	290
1. Preliminaries. Continuous Dependence on the Boundary Values and on the Domain.....	290

2. Solution of the Boundary Value Problem by the Schwarz Alternating Procedure.....	293
3. The Method of Integral Equations for Plane Regions with Sufficiently Smooth Boundaries.....	299
4. Remarks on Boundary Values.....	303
4a. Capacity and Assumption of Boundary Values.....	305
5. Perron's Method of Subharmonic Functions.....	306
§5. The Reduced Wave Equation. Scattering.....	312
1. Background.....	312
2. Sommerfeld's Radiation Condition.....	315
3. Scattering.....	318
§6. Boundary Value Problems for More General Elliptic Differential Equations. Uniqueness of the Solutions.....	320
1. Linear Differential Equations.....	320
2. Nonlinear Equations.....	322
3. Rellich's Theorem on the Monge-Ampère Differential Equation.....	324
4. The Maximum Principle and Applications.....	326
§7. A Priori Estimates of Schauder and Their Applications.....	331
1. Schauder's Estimates.....	332
2. Solution of the Boundary Value Problem.....	336
3. Strong Barrier Functions and Applications.....	341
4. Some Properties of Solutions of $L[u] = f$	343
5. Further Results on Elliptic Equations; Behavior at the Boundary.....	346
§8. Solution of the Beltrami Equations.....	350
§9. The Boundary Value Problem for a Special Quasi-Linear Equation. Fixed Point Method of Leray and Schauder.....	357
§10. Solution of Elliptic Differential Equations by Means of Integral Equations.....	362
1. Construction of Particular Solutions. Fundamental Solutions. Parametrix.....	363
2. Further Remarks.....	367
<i>Appendix to Chapter IV. Nonlinear Equations.....</i>	<i>367</i>
1. Perturbation Theory.....	368
2. The Equation $\Delta u = f(x, u)$	369
<i>Supplement to Chapter IV. Function Theoretic Aspects of the Theory of Elliptic Partial Differential Equations.....</i>	<i>374</i>
§1. Definition of Pseudoanalytic Functions.....	375
§2. An Integral Equation.....	377
§3. Similarity Principle.....	378
§4. Applications of the Similarity Principle.....	382
§5. Formal Powers.....	384
§6. Differentiation and Integration of Pseudoanalytic Functions...	386
§7. Example. Equations of Mixed Type.....	389
§8. General Definition of Pseudoanalytic Functions.....	391
§9. Quasiconformality and a General Representation Theorem....	392

§10. A Nonlinear Boundary Value Problem.....	395
§11. An Extension of Riemann's Mapping Theorem.....	399
§12. Two Theorems on Minimal Surfaces.....	400
§13. Equations with Analytic Coefficients.....	400
§14. Proof of Privaloff's Theorem.....	401
§15. Proof of the Schauder Fixed Point Theorem.....	403
V. Hyperbolic Differential Equations in Two Independent Variables	407
Introduction.....	407
§1. Characteristics for Differential Equations Mainly of Second Order.....	408
1. Basic Notions. Quasi-Linear Equations.....	408
2. Characteristics on Integral Surfaces.....	414
3. Characteristics as Curves of Discontinuity. Wave Fronts. Propagation of Discontinuities.....	416
4. General Differential Equations of Second Order.....	418
5. Differential Equations of Higher Order.....	421
6. Invariance of Characteristics under Point Transformations..	423
7. Reduction to Quasi-Linear Systems of First Order.....	423
§2. Characteristic Normal Forms for Hyperbolic Systems of First Order.....	424
1. Linear, Semilinear and Quasi-Linear Systems.....	424
2. The Case $k = 2$. Linearization by the Hodograph Transformation.....	427
§3. Applications to Dynamics of Compressible Fluids.....	429
1. One-Dimensional Isentropic Flow.....	429
2. Spherically Symmetric Flow.....	432
3. Steady Irrotational Flow.....	432
4. Systems of Three Equations for Nonisentropic Flow.....	434
5. Linearized Equations.....	436
§4. Uniqueness. Domain of Dependence.....	438
1. Domains of Dependence, Influence, and Determinacy.....	438
2. Uniqueness Proofs for Linear Differential Equations of Second Order.....	440
3. General Uniqueness Theorem for Linear Systems of First Order.....	445
4. Uniqueness for Quasi-Linear Systems.....	448
5. Energy Inequalities.....	449
§5. Riemann's Representation of Solutions.....	449
1. The Initial Value Problem.....	450
2. Riemann's Function.....	450
3. Symmetry of Riemann's Function.....	454
4. Riemann's Function and Radiation from a Point. Generalization to Higher Order Problems.....	455
5. Examples.....	457
§6. Solution of Hyperbolic Linear and Semilinear Initial Value Problems by Iteration.....	461
1. Construction of the Solution for a Second Order Equation....	462

2. Notations and Results for Linear and Semilinear Systems of First Order.....	464
3. Construction of the Solution.....	466
4. Remarks. Dependence of Solutions on Parameters.....	470
5. Mixed Initial and Boundary Value Problems.....	471
§7. Cauchy's Problem for Quasi-Linear Systems.....	476
§8. Cauchy's Problem for Single Hyperbolic Differential Equations of Higher Order.....	478
1. Reduction to a Characteristic System of First Order.....	479
2. Characteristic Representation of $L[u]$	480
3. Solution of Cauchy's Problem.....	482
4. Other Variants for the Solution. A Theorem by P. Ungar.....	483
5. Remarks.....	485
§9. Discontinuities of Solutions. Shocks.....	486
1. Generalized Solutions. Weak Solutions.....	486
2. Discontinuities for Quasi-Linear Systems Expressing Conservation Laws. Shocks.....	488
<i>Appendix 1 to Chapter V. Application of Characteristics as Coordinates</i> ...	490
§1. Additional Remarks on General Nonlinear Equations of Second Order.....	490
1. The Quasi-Linear Differential Equation.....	491
2. The General Nonlinear Equation.....	494
§2. The Exceptional Character of the Monge-Ampère Equation.....	495
§3. Transition from the Hyperbolic to the Elliptic Case Through Complex Domains.....	499
§4. The Analyticity of the Solutions in the Elliptic Case.....	501
1. Function-Theoretic Remark.....	501
2. Analyticity of the Solutions of $\Delta u = f(x, y, u, p, q)$	502
3. Remark on the General Differential Equation $F(x, y, u, p, q, r, s, t) = 0$	505
§5. Use of Complex Quantities for the Continuation of Solutions.....	505
<i>Appendix 2 to Chapter V. Transient Problems and Heaviside Operational Calculus</i>	507
§1. Solution of Transient Problems by Integral Representation.....	508
1. Explicit Example. The Wave Equation.....	508
2. General Formulation of the Problem.....	511
3. The Integral of Duhamel.....	512
4. Method of Superposition of Exponential Solutions.....	515
§2. The Heaviside Method of Operators.....	517
1. The Simplest Operators.....	518
2. Examples of Operators and Applications.....	521
3. Applications to Heat Conduction.....	525
4. Wave Equation.....	527
5. Justification of the Operational Calculus. Interpretation of Further Operators.....	528
§3. General Theory of Transient Problems.....	535
1. The Laplace Transformation.....	535

2. Solution of Transient Problems by the Laplace Transformation.....	539
3. Example. The Wave and Telegraph Equations.....	544
VI. Hyperbolic Differential Equations in More Than Two Independent Variables.....	551
Introduction.....	551
<i>PART I. Uniqueness, Construction, and Geometry of Solutions.....</i>	<i>552</i>
§1. Differential Equations of Second Order. Geometry of Characteristics.....	552
1. Quasi-Linear Differential Equations of Second Order.....	552
2. Linear Differential Equations.....	556
3. Rays or Bicharacteristics.....	558
4. Characteristics as Wave Fronts.....	560
5. Invariance of Characteristics.....	561
6. Ray Cone, Normal Cone, and Ray Conoid.....	563
7. Connection with a Riemann Metric.....	564
8. Reciprocal Transformations.....	566
9. Huyghens' Construction of Wave Fronts.....	568
10. Space-Like Surfaces. Time-Like Directions.....	569
§2. Second Order Equations. The Role of Characteristics.....	569
1. Discontinuities of Second Order.....	570
2. The Differential Equation along a Characteristic Surface....	571
3. Propagation of Discontinuities along Rays.....	573
4. Illustration. Solution of Cauchy's Problem for the Wave Equation in Three Space Dimensions.....	574
§3. Geometry of Characteristics for Higher Order Operators.....	577
1. Notation.....	577
2. Characteristic Surfaces, Forms, and Matrices.....	579
3. Interpretation of the Characteristic Condition in Time and Space. Normal Cone and Normal Surface. Characteristic Nullvectors and Eigenvalues.....	581
4. Construction of Characteristic Surfaces or Fronts. Rays, Ray Cone, Ray Conoid.....	583
5. Wave Fronts and Huyghens' Construction. Ray Surface and Normal Surfaces.....	585
5a. Example.....	588
6. Invariance Properties.....	589
7. Hyperbolicity. Space-Like Manifolds, Time-Like Directions..	589
8. Symmetric Hyperbolic Operators.....	593
9. Symmetric Hyperbolic Equations of Higher Order.....	594
10. Multiple Characteristic Sheets and Reducibility.....	595
11. Lemma on Bicharacteristic Directions.....	597
§3a. Examples. Hydrodynamics, Crystal Optics, Magnetohydrodynamics.....	599
1. Introduction.....	599

2. The Differential Equation System of Hydrodynamics.....	600
3. Crystal Optics.....	602
4. The Shapes of the Normal and Ray Surfaces.....	605
5. Cauchy's Problem for Crystal Optics.....	609
6. Magnetohydrodynamics.....	612
§4. Propagation of Discontinuities and Cauchy's Problem.....	618
1. Introduction.....	618
2. Discontinuities of First Derivatives for Systems of First Order. Transport Equation.....	618
3. Discontinuities of Initial Values. Introduction of Ideal Functions. Progressing Waves.....	620
4. Propagation of Discontinuities for Systems of First Order...	624
5. Characteristics with Constant Multiplicity.....	626
5a. Examples for Propagation of Discontinuities Along Manifolds of More Than One Dimension. Conical Refraction...	627
6. Resolution of Initial Discontinuities and Solution of Cauchy's Problem.....	629
6a. Characteristic Surfaces as Wave Fronts.....	631
7. Solution of Cauchy's Problem by Convergent Wave Expansions.....	632
8. Systems of Second and Higher Order.....	633
9. Supplementary Remarks. Weak Solutions. Shocks.....	635
§5. Oscillatory Initial Values. Asymptotic Expansion of the Solution. Transition to Geometrical Optics.....	636
1. Preliminary Remarks. Progressing Waves of Higher Order...	636
2. Construction of Asymptotic Solutions.....	637
3. Geometrical Optics.....	640
§6. Examples of Uniqueness Theorems and Domain of Dependence for Initial Value Problems.....	642
1. The Wave Equation.....	643
2. The Differential Equation $u_{tt} - \Delta u + \frac{\lambda}{t} u_t = 0$ (Darboux Equation).....	646
3. Maxwell's Equations in Vacuum.....	647
§7. Domains of Dependence for Hyperbolic Problems.....	649
1. Introduction.....	649
2. Description of the Domain of Dependence.....	650
§8. Energy Integrals and Uniqueness for Linear Symmetric Hyperbolic Systems of First Order.....	652
1. Energy Integrals and Uniqueness for the Cauchy Problem...	652
2. Energy Integrals of First and Higher Order.....	654
3. Energy Inequalities for Mixed Initial and Boundary Value Problems.....	656
4. Energy Integrals for Single Second Order Equations.....	659
§9. Energy Estimates for Equations of Higher Order.....	661
1. Introduction.....	661
2. Energy Identities and Inequalities for Solutions of Higher Order Hyperbolic Operators. Method of Leray and Gårding.	662
3. Other Methods.....	666

§10. The Existence Theorem	668
1. Introduction	668
2. The Existence Theorem	669
3. Remarks on Persistence of Properties of Initial Values and on Corresponding Semigroups. Huyghens' Minor Principle . . .	671
4. Focussing. Example of Nonpersistence of Differentiability . . .	673
5. Remarks about Quasi-Linear Systems	675
6. Remarks about Problems of Higher Order or Nonsymmetric Systems	675
<i>PART II. Representation of Solutions</i>	676
§11. Introduction	676
1. Outline. Notations	676
2. Some Integral Formulas. Decomposition of Functions into Plane Waves	677
§12. Equations of Second Order with Constant Coefficients	681
1. Cauchy's Problem	681
2. Construction of the Solution for the Wave Equation	683
3. Method of Descent	686
4. Further Discussion of the Solution. Huyghens' Principle	688
5. The Nonhomogeneous Equation. Duhamel's Integral	691
6. Cauchy's Problem for the General Linear Equation of Second Order	692
7. The Radiation Problem	695
§13. Method of Spherical Means. The Wave Equation and the Darboux Equation	699
1. Darboux's Differential Equation for Mean Values	699
2. Connection with the Wave Equation	700
3. The Radiation Problem for the Wave Equation	703
4. Generalized Progressing Spherical Waves	704
§13a. The Initial Value Problem for Elastic Waves Solved by Spherical Means	706
§14. Method of Plane Mean Values. Application to General Hyperbolic Equations with Constant Coefficients	711
1. General Method	711
2. Application to the Solution of the Wave Equation	715
§14a. Application to the Equations of Crystal Optics and Other Equa- tions of Fourth Order	718
1. Solution of Cauchy's Problem	718
2. Further Discussion of the Solution. Domain of Dependence. Gaps	723
§15. The Solution of Cauchy's Problem as Linear Functional of the Data. Fundamental Solutions	727
1. Description. Notations	727
2. Construction of the Radiation Function by Decomposition of the Delta Function	730
3. Regularity of the Radiation Matrix	733
3a. The Generalized Huyghens Principle	735

4. Example. Special Linear Systems with Constant Coefficients. Theorem on Gaps	736
5. Example. The Wave Equation	737
6. Example. Hadamard's Theory for Single Equations of Second Order	740
7. Further Examples. Two Independent Variables. Remarks...	744
§16. Ultrahyperbolic Differential Equations and General Differential Equations of Second Order with Constant Coefficients	744
1. The General Mean Value Theorem of Asgeirsson	744
2. Another Proof of the Mean Value Theorem	748
3. Application to the Wave Equation	749
4. Solutions of the Characteristic Initial Value Problem for the Wave Equation	749
5. Other Applications. The Mean Value Theorem for Confocal Ellipsoids	752
§17. Initial Value Problems for Non-Space-Like Initial Manifolds...	754
1. Functions Determined by Mean Values over Spheres with Centers in a Plane	754
2. Applications to the Initial Value Problem	756
§18. Remarks About Progressing Waves, Transmission of Signals and Huyghens' Principle	760
1. Distortion-Free Progressing Waves	760
2. Spherical Waves	763
3. Radiation and Huyghens' Principle	764
<i>Appendix to Chapter VI. Ideal Functions or Distributions</i>	766
§1. Underlying Definitions and Concepts	766
1. Introduction	766
2. Ideal Elements	767
3. Notations and Definitions	768
4. Iterated Integration	769
5. Linear Functionals and Operators -Bilinear Form	769
6. Continuity of Functionals. Support of Test Functions	771
7. Lemma About r -Continuity	772
8. Some Auxiliary Functions	773
9. Examples	774
§2. Ideal Functions	774
1. Introduction	774
2. Definition by Linear Differential Operators	775
3. Definition by Weak Limits	777
4. Definition by Linear Functionals	778
5. Equivalence. Representation of Functionals	779
6. Some Conclusions	781
7. Example. The Delta-Function	781
8. Identification of Ideal with Ordinary Functions	783
9. Definite Integrals. Finite Parts	785
§3. Calculus with Ideal Functions	788
1. Linear Processes	789

2. Change of Independent Variables	789
3. Examples. Transformations of the Delta-Function.....	790
4. Multiplication and Convolution of Ideal Functions.....	791
§4. Additional Remarks. Modifications of the Theory	792
1. Introduction.....	792
2. Different Spaces of Test Functions. The Space $\mathcal{S}$. Fourier Transforms.....	793
3. Periodic Functions.....	795
4. Ideal Functions and Hilbert Spaces. Negative Norms. Strong Definitions	796
5. Remark on Other Classes of Ideal Functions.....	797
Bibliography	799
Index	819
