

CONTENTS

I. The Algebra of Linear Transformations and Quadratic Forms . . .	1
§1. Linear equations and linear transformations	1
1. Vectors	1
2. Orthogonal systems of vectors. Completeness	3
3. Linear transformations. Matrices	5
4. Bilinear, quadratic, and Hermitian forms	11
5. Orthogonal and unitary transformations	14
§2. Linear transformations with a linear parameter	17
§3. Transformation to principal axes of quadratic and Hermitian forms	23
1. Transformation to principal axes on the basis of a maximum principle	23
2. Eigenvalues	26
3. Generalization to Hermitian forms	28
4. Inertial theorem for quadratic forms	28
5. Representation of the resolvent of a form	29
6. Solution of systems of linear equations associated with forms	30
§4. Minimum-maximum property of eigenvalues	31
1. Characterization of eigenvalues by a minimum-maximum problem	31
2. Applications. Constraints	33
§5. Supplement and problems	34
1. Linear independence and the Gram determinant	34
2. Hadamard's inequality for determinants	36
3. Generalized treatment of canonical transformations	37
4. Bilinear and quadratic forms of infinitely many variables . .	41
5. Infinitesimal linear transformations	41
6. Perturbations	42
7. Constraints	44
8. Elementary divisors of a matrix or a bilinear form	45
9. Spectrum of a unitary matrix	46
<i>References</i>	47
II. Series Expansions of Arbitrary Functions	48
§1. Orthogonal systems of functions	49
1. Definitions	49
2. Orthogonalization of functions	50
3. Bessel's inequality. Completeness relation. Approximation in the mean	51

4. Orthogonal and unitary transformations with infinitely many variables	55
5. Validity of the results for several independent variables. More general assumptions	56
6. Construction of complete systems of functions of several variables	56
§2. The accumulation principle for functions	57
1. Convergence in function space	57
§3. Measure of independence and dimension number	61
1. Measure of independence	61
2. Asymptotic dimension of a sequence of functions	63
§4. Weierstrass's approximation theorem. Completeness of powers and of trigonometric functions	65
1. Weierstrass's approximation theorem	65
2. Extension to functions of several variables	68
3. Simultaneous approximation of derivatives	68
4. Completeness of the trigonometric functions	68
§5. Fourier series	69
1. Proof of the fundamental theorem	69
2. Multiple Fourier series	73
3. Order of magnitude of Fourier coefficients	74
4. Change in length of basic interval	74
5. Examples	74
§6. The Fourier integral	77
1. The fundamental theorem	77
2. Extension of the result to several variables	79
3. Reciprocity formulas	80
§7. Examples of Fourier integrals	81
§8. Legendre polynomials	82
1. Construction of the Legendre polynomials by orthogonalization of the powers $1, x, x^2, \dots$	82
2. The generating function	85
3. Other properties of the Legendre polynomials	86
(a) Recursion formula	
(b) Differential equation	
(c) Minimum property	
§9. Examples of other orthogonal systems	87
1. Generalization of the problem leading to Legendre polynomials	87
2. Tchebycheff polynomials	88
3. Jacobi polynomials	90
4. Hermite polynomials	91
5. Laguerre polynomials	93
6. Completeness of the Laguerre and Hermite functions	95
§10. Supplement and problems	97
1. Hurwitz's solution of the isoperimetric problem	97
2. Reciprocity formulas	98
3. The Fourier integral and convergence in the mean	98

4. Spectral decomposition by Fourier series and integrals.....	99
5. Dense systems of functions.....	100
6. A Theorem of H. Müntz on the completeness of powers....	102
7. Fejér's summation theorem.....	102
8. The Mellin inversion formulas.....	103
9. The Gibbs phenomenon.....	105
10. A theorem on Gram's determinant.....	107
11. Application of the Lebesgue integral.....	108
<i>References</i>	111
III. Linear Integral Equations	112
§1. Introduction.....	112
1. Notation and basic concepts.....	112
2. Functions in integral representation.....	113
3. Degenerate kernels.....	114
§2. Fredholm's theorems for degenerate kernels.....	115
§3. Fredholm's theorems for arbitrary kernels.....	118
§4. Symmetric kernels and their eigenvalues.....	122
1. Existence of an eigenvalue of a symmetric kernel.....	122
2. The totality of eigenfunctions and eigenvalues.....	126
3. Maximum-minimum property of eigenvalues.....	132
§5. The expansion theorem and its applications.....	134
1. Expansion theorem.....	134
2. Solution of the inhomogeneous linear integral equation....	136
3. Bilinear formula for iterated kernels.....	137
4. Mercer's theorem.....	138
§6. Neumann series and the reciprocal kernel.....	140
§7. The Fredholm formulas.....	142
§8. Another derivation of the theory.....	147
1. A lemma.....	147
2. Eigenfunctions of a symmetric kernel.....	148
3. Unsymmetric kernels.....	150
4. Continuous dependence of eigenvalues and eigenfunctions on the kernel.....	151
§9. Extensions of the theory.....	152
§10. Supplement and problems for Chapter III.....	153
1. Problems.....	153
2. Singular integral equations.....	154
3. E. Schmidt's derivation of the Fredholm theorems.....	155
4. Enskog's method for solving symmetric integral equations.	156
5. Kellogg's method for the determination of eigenfunctions..	156
6. Symbolic functions of a kernel and their eigenvalues.....	157
7. Example of an unsymmetric kernel without null solutions..	157
8. Volterra integral equation.....	158
9. Abel's integral equation.....	158
10. Adjoint orthogonal systems belonging to an unsymmetric kernel.....	159
11. Integral equations of the first kind.....	159

12. Method of infinitely many variables.....	160
13. Minimum properties of eigenfunctions.....	161
14. Polar integral equations.....	161
15. Symmetrizable kernels.....	161
16. Determination of the resolvent kernel by functional equations.....	162
17. Continuity of definite kernels.....	162
18. Hammerstein's theorem.....	162
<i>References</i>	162
IV. The Calculus of Variations	164
§1. Problems of the calculus of variations.....	164
1. Maxima and minima of functions.....	164
2. Functionals.....	167
3. Typical problems of the calculus of variations.....	169
4. Characteristic difficulties of the calculus of variations.....	173
§2. Direct solutions.....	174
1. The isoperimetric problem.....	174
2. The Rayleigh-Ritz method. Minimizing sequences.....	175
3. Other direct methods. Method of finite differences. Infinitely many variables.....	176
4. General remarks on direct methods of the calculus of variations.....	182
§3. The Euler equations.....	183
1. "Simplest problem" of the variational calculus.....	184
2. Several unknown functions.....	187
3. Higher derivatives.....	190
4. Several independent variables.....	191
5. Identical vanishing of the Euler differential expression.....	193
6. Euler equations in homogeneous form.....	196
7. Relaxing of conditions. Theorems of du Bois-Reymond and Haar.....	199
8. Variational problems and functional equations.....	205
§4. Integration of the Euler differential equation.....	206
§5. Boundary conditions.....	208
1. Natural boundary conditions for free boundaries.....	208
2. Geometrical problems. Transversality.....	211
§6. The second variation and the Legendre condition.....	214
§7. Variational problems with subsidiary conditions.....	216
1. Isoperimetric problems.....	216
2. Finite subsidiary conditions.....	219
3. Differential equations as subsidiary conditions.....	221
§8. Invariant character of the Euler equations.....	222
1. The Euler expression as a gradient in function space. Invariance of the Euler expression.....	222
2. Transformation of Δu . Spherical coordinates.....	224
3. Ellipsoidal coordinates.....	226

§9. Transformation of variational problems to canonical and involutory form.....	231
1. Transformation of an ordinary minimum problem with subsidiary conditions.....	231
2. Involutory transformation of the simplest variational problems.....	233
3. Transformation of variational problems to canonical form..	238
4. Generalizations.....	240
§10. Variational calculus and the differential equations of mathematical physics.....	242
1. General remarks.....	242
2. The vibrating string and the vibrating rod.....	244
3. Membrane and plate.....	246
§11. Reciprocal quadratic variational problems.....	252
§12. Supplementary remarks and exercises.....	257
1. Variational problem for a given differential equation.....	257
2. Reciprocity for isoperimetric problems.....	258
3. Circular light rays.....	258
4. The problem of Dido.....	258
5. Examples of problems in space.....	258
6. The indicatrix and applications.....	258
7. Variable domains.....	260
8. E. Noether's theorem on invariant variational problems. Integrals in particle mechanics.....	262
9. Transversality for multiple integrals.....	266
10. Euler's differential expressions on surfaces.....	267
11. Thomson's principle in electrostatics.....	267
12. Equilibrium problems for elastic bodies. Castigliano's principle.....	268
13. The variational problem of buckling.....	272
<i>References</i>	274
V. Vibration and Eigenvalue Problems.....	275
§1. Preliminary remarks about linear differential equations.....	275
1. Principle of superposition.....	275
2. Homogeneous and nonhomogeneous problems. Boundary conditions.....	277
3. Formal relations. Adjoint differential expressions. Green's formulas.....	277
4. Linear functional equations as limiting cases and analogues of systems of linear equations.....	280
§2. Systems of a finite number of degrees of freedom.....	281
1. Normal modes of vibration. Normal coordinates. General theory of motion.....	282
2. General properties of vibrating systems.....	285
§3. The vibrating string.....	286
1. Free motion of the homogeneous string.....	287

2. Forced motion.....	289
3. The general nonhomogeneous string and the Sturm-Liouville eigenvalue problem.....	291
§4. The vibrating rod.....	295
§5. The vibrating membrane.....	297
1. General eigenvalue problem for the homogeneous membrane.....	297
2. Forced motion.....	300
3. Nodal lines.....	300
4. Rectangular membrane.....	300
5. Circular membrane. Bessel functions.....	302
6. Nonhomogeneous membrane.....	306
§6. The vibrating plate.....	307
1. General remarks.....	307
2. Circular boundary.....	307
§7. General remarks on the eigenfunction method.....	308
1. Vibration and equilibrium problems.....	308
2. Heat conduction and eigenvalue problems.....	311
§8. Vibration of three-dimensional continua. Separation of variables.....	313
§9. Eigenfunctions and the boundary value problem of potential theory.....	315
1. Circle, sphere, and spherical shell.....	315
2. Cylindrical domain.....	319
3. The Lamé problem.....	319
§10. Problems of the Sturm-Liouville type. Singular boundary points.....	324
1. Bessel functions.....	324
2. Legendre functions of arbitrary order.....	325
3. Jacobi and Tchebycheff polynomials.....	327
4. Hermite and Laguerre polynomials.....	328
§11. The asymptotic behavior of the solutions of Sturm-Liouville equations.....	331
1. Boundedness of the solution as the independent variable tends to infinity.....	331
2. A sharper result. (Bessel functions).....	332
3. Boundedness as the parameter increases.....	334
4. Asymptotic representation of the solutions.....	335
5. Asymptotic representation of Sturm-Liouville eigenfunctions.....	336
§12. Eigenvalue problems with a continuous spectrum.....	339
1. Trigonometric functions.....	340
2. Bessel functions.....	340
3. Eigenvalue problem of the membrane equation for the infinite plane.....	341
4. The Schrödinger eigenvalue problem.....	341
§13. Perturbation theory.....	343

1. Simple eigenvalues.....	344
2. Multiple eigenvalues.....	346
3. An example.....	348
§14. Green's function (influence function) and reduction of differential equations to integral equations.....	351
1. Green's function and boundary value problem for ordinary differential equations.....	351
2. Construction of Green's function; Green's function in the generalized sense.....	354
3. Equivalence of integral and differential equations.....	358
4. Ordinary differential equations of higher order.....	362
5. Partial differential equations.....	36'
§15. Examples of Green's function.....	371
1. Ordinary differential equations.....	371
2. Green's function for Δu : circle and sphere.....	377
3. Green's function and conformal mapping.....	377
4. Green's function for the potential equation on the surface of a sphere.....	378
5. Green's function for $\Delta u = 0$ in a rectangular parallelepiped.....	378
6. Green's function for Δu in the interior of a rectangle.....	384
7. Green's function for a circular ring.....	386
§16. Supplement to Chapter V.....	388
1. Examples for the vibrating string.....	388
2. Vibrations of a freely suspended rope; Bessel functions....	390
3. Examples for the explicit solution of the vibration equation. Mathieu functions.....	391
4. Boundary conditions with parameters.....	392
5. Green's tensors for systems of differential equations.....	393
6. Analytic continuation of the solutions of the equation $\Delta u + \lambda u = 0$	395
7. A theorem on the nodal curves of the solutions of $\Delta u + \lambda u = 0$	395
8. An example of eigenvalues of infinite multiplicity.....	395
9. Limits for the validity of the expansion theorems.....	395
<i>References</i>	396

VI. Application of the Calculus of Variations to Eigenvalue Problems. . 397

§1. Extremum properties of eigenvalues.....	398
1. Classical extremum properties.....	398
2. Generalizations.....	402
3. Eigenvalue problems for regions with separate components.....	405
4. The maximum-minimum property of eigenvalues.....	405
§2. General consequences of the extremum properties of the eigenvalues.....	407
1. General theorems.....	407

2. Infinite growth of the eigenvalues.....	412
3. Asymptotic behavior of the eigenvalues in the Sturm-Liouville problem.....	414
4. Singular differential equations.....	415
5. Further remarks concerning the growth of eigenvalues. Occurrence of negative eigenvalues.....	416
6. Continuity of eigenvalues.....	418
§3. Completeness and expansion theorems.....	424
1. Completeness of the eigenfunctions.....	424
2. The expansion theorem.....	426
3. Generalization of the expansion theorem.....	427
§4. Asymptotic distribution of eigenvalues.....	429
1. The equation $\Delta u + \lambda u = 0$ for a rectangle.....	429
2. The equation $\Delta u + \lambda u = 0$ for domains consisting of a finite number of squares or cubes.....	431
3. Extension to the general differential equation $L[u] + \lambda \rho u = 0$	434
4. Asymptotic distribution of eigenvalues for an arbitrary domain.....	436
5. Sharper form of the laws of asymptotic distribution of eigenvalues for the differential equation $\Delta u + \lambda u = 0$...	443
§5. Eigenvalue problems of the Schrödinger type.....	445
§6. Nodes of eigenfunctions.....	451
§7. Supplementary remarks and problems.....	455
1. Minimizing properties of eigenvalues. Derivation from completeness.....	455
2. Characterization of the first eigenfunction by absence of nodes.....	458
3. Further minimizing properties of eigenvalues.....	459
4. Asymptotic distribution of eigenvalues.....	460
5. Parameter eigenvalue problems.....	460
6. Boundary conditions containing parameters.....	461
7. Eigenvalue problems for closed surfaces.....	461
8. Estimates of eigenvalues when singular points occur.....	461
9. Minimum theorems for the membrane and plate.....	463
10. Minimum problems for variable mass distribution.....	463
11. Nodal points for the Sturm-Liouville problem. Maximum-minimum principle.....	463
