Contents

Preface — V

Introduction — 1

1 Derivation of the Landau equation — 4
1.1 From Boltzmann equation to Landau equation — **4**
1.2 Generalized Landau equation — **11**
1.3 Transport cross-section of scattering in a weak central field — **13**
1.4 From BBGKY hierarchy to Landau equation — **20**
1.5 General comments on the Landau-type equations — **25**
Remarks on Chapter 1 — **27**

2 Radially symmetric Landau equation and its models — 29
2.1 General properties of the Landau equation — **29**
2.2 Radial solutions and related models — **32**
2.3 Competition of diffusion and friction force — **34**
2.4 Exactly solvable model — **38**
2.5 Solutions of the model equation — **40**
2.6 Models with variable diffusion coefficients — **43**
2.7 Moment equations for the Landau equation — **47**
2.8 Estimates of exponential moment $I_3(\lambda, t)$ and generalizations — **51**
2.9 Asymptotic solutions and high-energy tails — **55**
Remarks on Chapter 2 — **59**

3 Numerical methods for the Landau equation — 60
3.1 Landau equation in Fokker–Planck form — **60**
3.2 Brief review of numerical methods — **60**
3.3 The completely conservative difference schemes for the Landau–Fokker–Planck equation — **64**
3.4 Example of the difference scheme for the generalized Landau equation — **66**
3.5 Monte Carlo methods for LFPE — **73**
3.6 General stochastic method — **76**
Remarks on Chapter 3 — **82**

4 Applications of the Vlasov–Landau equation — 83
4.1 Vlasov–Landau equation for weakly interacting systems — **83**
4.2 Vlasov–Poisson–Landau equation for plasma — **86**
4.3 Asymptotic solutions of VPLE — **89**
4.4 Behavior of $E^{\varepsilon}(x, t)$ for $\varepsilon \to 0$ — **91**

digitalisiert durch DEUTSCHE NATIONAL BIBLIOTHEK

4.5 Well-posedness of limiting kinetic equation — **93**
4.6 Linearized Vlasov–Poisson equation — **96**
4.7 More on vibrations of electric field — **104**
4.8 The case of strong oscillations — **109**
4.9 Numerical examples — **114**
4.10 Conclusions — **123**
Remarks on Chapter 4 — **124**

5 Discrete models of the Boltzmann equation — 125
5.1 Introduction to discrete velocity models of the Boltzmann equation — **125**
5.2 Construction of normal discrete models — **127**
5.3 General discrete kinetic models — **130**
5.4 Normal DKMs with given conservation laws — **132**
5.5 On classification of normal discrete models of the Boltzmann equation — **134**
Remarks on Chapter 5 — **136**

6 Discrete models of the Boltzmann equation and dynamical systems — 137
6.1 General ideas — **137**
6.2 Statement of the problem — **138**
6.3 DVM as dynamical system — **141**
6.4 Linearized equation — **142**
6.5 Indices of stationary points — **147**
6.6 Applications to half-space problems — **150**
6.7 The shock wave problem — **153**
6.8 Assumptions and main results — **154**
6.9 Transformation of the problem and sketch of the proof — **156**
Remarks on Chapter 6 — **160**

7 General Boltzmann-type equations — 161
7.1 Generalization of the Boltzmann equation — **161**
7.2 Conservation laws and generalized H-theorem — **164**
7.3 Nordheim–Uehling–Uhlenbeck equation and wave kinetic equation — **166**
7.4 Discrete kinetic models — **168**
7.5 Properties of discrete models — **170**
7.6 Some transformations of equations and initial data — **173**
7.7 Convergence to equilibrium for discrete models of WKE: Formulation of the main result — **173**
7.8 Existence and uniqueness of global nonnegative solutions — **175**
7.9 Existence of unique stationary solution — **178**
7.10 Properties of the stationary solution — **180**
7.11 Proof of convergence to equilibrium — **181**

7.12 On approximation of Boltzmann-type equations by discrete kinetic models — **184**
7.13 Concluding remarks on Chapter 7 — **189**

Bibliography — 191

Index — 199
