

Contents

Acknowledgements — VII

About this book — XVII

About the authors — XIX

1 Introduction — 1

- 1.1 First light — 1
- 1.2 The origin of photon sciences — 3
- 1.3 Early synchrotron XAS facilities — 3
- 1.4 A first visit to SSRL — 5
- 1.5 Rapid development — 5
- 1.6 The generation game — 6
- 1.7 X-ray absorption spectroscopy — 7
- References — 8

2 Sources of synchrotron radiation — 9

- 2.1 Introduction — 9
- 2.2 The Lorentz force — 9
- 2.3 Electromagnetic radiation from accelerated charged particles — 9
- 2.4 Synchrotron radiation spectrum and time structure — 12
- 2.5 Beam current — 13
- 2.6 Electron beam emittance — 13
- 2.7 Spectral brightness — 14
- 2.8 Polarization and coherence — 15
- 2.9 Components of synchrotron radiation facilities — 16
 - 2.9.1 The electron source, linear accelerator and booster synchrotron — 16
 - 2.9.2 The radio frequency (RF) system — 17
 - 2.9.3 Magnetic lattice — 18
- 2.10 Beam orbits and beam losses — 20
- 2.11 Bend magnet sources — 21
 - 2.11.1 Superbend magnets — 21
- 2.12 Wigglers and undulators — 21
- Further reading — 29

3 X-ray beamlines — 30

- 3.1 Introduction — 30
- 3.2 Hard X-ray monochromators — 30
 - 3.2.1 Monochromator crystals — 32
 - 3.2.2 Double-crystal monochromators — 32

3.2.3	Crystal monochromator energy resolution and range —	34
3.2.4	The harmonic rejection problem and crystal detuning —	36
3.2.5	Monochromator crystal glitches —	38
3.2.6	Monochromator designs —	39
3.2.7	Some corrections to the simple picture —	40
3.2.8	Specialized crystal monochromators —	42
3.3	Soft X-ray monochromators —	43
3.4	X-ray mirrors —	46
3.4.1	Polarization and mirrors —	47
3.4.2	X-ray mirror coatings —	48
3.4.3	X-ray mirrors in harmonic rejection —	49
3.4.4	X-ray mirror optical figures —	50
3.5	The other pieces: filters, windows, masks and slits —	55
3.6	Radiation shielding and personnel protection —	55
3.6.1	Radiation shielding —	55
3.6.2	Experimental hutch —	56
4	Interactions of X-rays with matter —	58
4.1	Background concepts – wave particle duality —	58
4.2	Background concepts – quantum numbers —	60
4.3	X-ray scattering —	61
4.3.1	Elastic X-ray scattering —	61
4.3.2	Inelastic X-ray scattering —	62
4.4	X-ray absorption —	64
4.5	Selection rules and photoexcitation —	67
4.6	X-ray fluorescence and Auger emission —	69
4.7	X-ray photoabsorption timescales —	74
4.8	Nomenclature —	75
4.9	X-ray absorption by molecules and solids —	76
	References —	83
5	X-ray detectors and detector systems —	84
5.1	Introduction —	84
5.2	Gas ionization chambers —	84
5.2.1	Ion chamber function —	84
5.2.2	Proportional counters and Geiger-Muller detectors —	85
5.2.3	Gas ionization chamber readout —	87
5.2.4	Calculation of photon flux using a gas ionization detector —	88
5.2.5	Choice of ion chamber fill gas —	88
5.2.6	Ion chamber Soller slits —	89
5.2.7	Gridded ion chamber designs —	90
5.2.8	Fluorescent ion chamber detectors —	91

5.3	Photodiodes — 92
5.4	Energy-dispersive solid-state X-ray detectors — 92
5.4.1	Germanium detectors — 93
5.4.2	Lithium-drifted silicon detectors — 94
5.4.3	Silicon drift detectors — 95
5.4.4	Detector readout – analog pulse processing — 97
5.4.5	Detector readout – digital signal processing — 98
5.4.6	Energy resolution and noise — 101
5.4.7	Count rates and detector dead times — 102
5.4.8	Array detectors — 104
5.4.9	Filters and Soller slits — 105
5.4.10	Neutral X-ray filters — 106
5.4.11	Escape peaks — 107
5.4.12	Solid-state detector readout – binning versus fitting — 109
5.5	Scintillation detectors — 110
5.6	Advanced photon detectors — 111
5.6.1	Transition edge sensor detectors — 111
5.6.2	Superconducting tunnel junction detectors — 112
5.7	Crystal optics-based photon detectors — 112
5.7.1	Types of crystal diffractive optics — 113
5.7.2	Log-spiral bent Laue detector systems — 113
5.7.3	Bent crystal Bragg optics — 114
5.7.4	Johann geometry — 115
5.7.5	The Von Hamos spectrometer — 116
5.7.6	Johansson geometry — 117
5.8	Electron detectors — 118
5.8.1	Gas-amplified total electron yield detector — 118
5.8.2	The channeltron electron multiplier — 119
5.8.3	Drain current — 121
5.8.4	Energy-dispersive electron energy analysers — 121
	Further reading — 122
	References — 122
6	The X-ray absorption spectroscopy experiment – I — 124
6.1	Introduction — 124
6.2	Hard X-ray experiments — 125
6.3	Tender X-ray experiments — 128
6.4	Soft X-ray experiments — 132
6.5	<i>In situ</i> experiments — 133
	References — 134

7 The X-ray absorption spectroscopy experiment – II — 135

- 7.1 Introduction — **135**
- 7.2 Solid sample preparation for hard X-ray transmittance measurements — **135**
 - 7.2.1 Powder diluents — **135**
 - 7.2.2 Adhesive tape — **136**
- 7.3 Calculation of total X-ray absorbance — **139**
- 7.4 Solid samples for tender and soft X-ray fluorescence/electron yield — **142**
- 7.5 Solution sample preparation — **142**
 - 7.5.1 Filling the sample cuvette — **143**
 - 7.5.2 Freezing the sample — **144**
- 7.6 Safety considerations — **145**
- 7.7 Signal contamination — **146**
- 7.8 Data acquisition strategies for XAS — **147**
- 7.9 Incident X-ray energy calibration — **149**

8 The EXAFS — 152

- 8.1 Introduction — **152**
- 8.2 X-ray photoabsorption — **152**
- 8.3 A simple expression for the EXAFS — **153**
- 8.4 The EXAFS equation — **156**
 - 8.4.1 Central atom effects — **156**
 - 8.4.2 The photoelectron mean free path — **158**
 - 8.4.3 The photoelectron backscattering phase and amplitude — **159**
 - 8.4.4 The Debye-Waller factor — **159**
- 8.5 Polarized EXAFS — **166**
- 8.6 Atomic X-ray absorption fine structure — **169**
- 8.7 Multiple scattering EXAFS — **170**
- References — **175**

9 The near-edge structure — 177

- 9.1 Introduction — **177**
- 9.2 Electric dipole and electric quadrupole transitions — **177**
- 9.3 Chemical sensitivity of near-edge spectra — **181**
 - 9.3.1 Oxidation state sensitivity — **181**
 - 9.3.2 Sensitivity to chemical bonding — **183**
 - 9.3.3 Sensitivity to coordination geometry — **183**
 - 9.3.4 Site symmetry and the near-edge spectrum — **184**
- 9.4 Polarization dependence of near-edge spectra — **192**
- 9.5 Shake-down and shake-up transitions — **195**
- 9.6 Electron spin effects — **198**

9.6.1	Spin-orbit coupling — 198
9.6.2	X-ray magnetic circular dichroism — 199
9.7	Spectral linewidths — 203
9.8	Multiplet splittings — 205
9.9	Calculation of near-edge spectra — 206
9.9.1	Multiplet calculations — 207
9.9.2	Multiple scattering calculations — 207
9.9.3	Density functional theory — 209
9.9.4	Time-dependent density functional theory — 209
9.10	Peak deconvolution of near-edge spectra — 210
	References — 212
10	Analysis I – EXAFS data reduction and analysis — 214
10.1	Signal averaging and screening — 214
10.2	Background removal and normalization – removing the pre-edge — 215
10.3	Background removal and normalization – the spline — 219
10.4	The EXAFS — 221
10.5	Sensitivities of the EXAFS — 223
10.5.1	Sensitivity to structural parameters and threshold energy — 223
10.5.2	Sensitivity to backscatterer type — 223
10.6	The EXAFS Fourier transform — 224
10.6.1	k-Windowing — 227
10.6.2	R-windowing – Fourier filtering — 229
10.6.3	Extraction of phase and amplitude functions using Fourier methods — 230
10.6.4	Wavelet transforms — 231
10.6.5	Maximum entropy transforms — 232
10.7	EXAFS curve fitting – goodness of fit, accuracies and precisions — 233
10.7.1	Goodness of fit: metrics of fit quality — 233
10.7.2	Accuracy and precision — 234
10.8	EXAFS curve-fitting analysis — 235
10.8.1	EXAFS bond length resolution — 237
10.8.2	Number of relevant independent points in EXAFS analysis — 238
10.8.3	EXAFS cancellation — 239
10.8.4	Physical and chemical checks – do the derived structural parameters make sense? — 240
10.8.5	Getting fooled – confusion of backscatterers and lack of control of ΔE_0 — 242
10.8.6	EXAFS range — 244
10.8.7	Reporting the results of EXAFS curve-fitting analysis — 245

10.9	Multiple-scattering EXAFS analysis —	246
10.10	Putting it all together . . . —	249
	References —	251
11	Analysis II – speciation —	253
11.1	Linear combination analysis —	254
11.2	Choice of standard compounds —	258
11.3	Determining the number of components in linear combination analysis —	261
11.4	Principal component analysis —	261
11.5	Target factor analysis —	267
11.6	Linear combination fits from singular value decomposition —	269
11.7	Principal component analysis of the EXAFS —	271
11.8	Data analytics —	272
	References —	274
12	Experimental artefacts —	276
12.1	Introduction —	276
12.2	Transmittance leakage effects —	276
12.3	Fluorescence self-absorption —	277
12.4	Electron yield sample charging effects —	283
12.5	Solid-state detector dead time effects and related phenomena —	284
12.5.1	Ice diffraction and detector dead time —	285
12.5.2	Variations in peaking time of digital signal processing hardware —	287
12.6	Energy calibration standard fluorescence leakage —	288
12.7	Radiation damage —	289
12.8	Problems with dark currents (offsets) —	294
12.9	Inadequate ion chamber sweeping voltage —	295
12.10	Preferred orientation of powders —	295
	References —	296
13	XAS imaging —	298
13.1	Introduction —	298
13.2	Micro-focus optics —	298
13.2.1	Refractive optics —	298
13.2.2	Reflective optics – X-ray capillaries and mirrors —	300
13.2.3	Diffraction optics – Fresnel zone plates —	302
13.3	Raster scanning the sample —	304
13.4	Spectroscopic imaging – beyond elemental mapping —	305
13.4.1	X-ray fluorescence imaging —	305
13.4.2	Experimental geometries —	307
13.4.3	μ -XAS —	309

13.4.4	Spectroscopic imaging using a small number of incident energies —	310
13.4.5	Full-spectrum spectroscopic imaging —	313
13.4.6	Full-field and wide-field spectroscopic imaging —	314
13.4.7	Three-dimensional methods – tomography —	315
13.4.8	Three-dimensional methods – confocal X-ray fluorescence imaging —	316
13.5	Sample environment —	317
	References —	319
14	High-energy resolution methods —	321
14.1	Introduction —	321
14.2	The Johann geometry array spectrometer —	321
14.3	Hard X-ray emission spectroscopy (XES) and minor line XES —	324
14.4	Tender X-ray XES —	325
14.5	Soft X-ray XES —	328
14.6	High-energy resolution fluorescence detected XAS (HERFD-XAS) —	329
14.6.1	HERFD-XAS nomenclature —	332
14.6.2	Selection of HERFD-XAS analyser crystals —	333
14.6.3	Anatomy of a HERFD-XAS experiment —	335
14.6.4	Importance of accurate emission line determination —	335
14.6.5	HERFD-XAS of dilute systems —	336
14.6.6	HERFD-XAS of concentrated systems —	338
14.6.7	HERFD-XAS speciation analysis of mixtures with fluorescence chemical shifts —	339
14.6.8	High-energy resolution electron yield detected X-ray absorption spectroscopy —	339
14.7	The RIXS plane —	340
14.8	X-ray Raman scattering —	344
	References —	347
15	XAS using diffraction and reflection —	349
15.1	Introduction —	349
15.2	Diffraction anomalous fine structure —	349
15.2.1	X-ray diffraction and anomalous scattering —	352
15.2.2	Analysis of the DAFS —	354
15.2.3	Extraction of polarized spectra from powder DAFS —	356
15.2.4	Metalloprotein and single-crystal DAFS —	358
15.3	The Borrmann effect —	361
15.4	Grazing incidence X-ray absorption spectroscopy —	362
	References —	365

XVI — Contents

16 New and future sources for XAS — 367

- 16.1 Introduction — **367**
- 16.2 Inverse Compton X-ray sources — **367**
- 16.3 Laser-wakefield X-ray sources — **368**
- 16.4 XAS with free electron laser sources — **368**
- References — **370**

Closing remarks — 371

Appendix A Complex numbers — 373

Appendix B Fourier transforms — 377

Appendix C Elements of quantum mechanical nomenclature — 387

Appendix D The EXAFSPAK analysis code — 397

Index — 399
