Symbols	7
1. Introduction	9
1.1. Problem description and motivation	9
1.2. State of the art	10
1.3. Aim and scope	11
2. Continuum mechanical modeling	15
2.1. The geometry of motion and deformation	17
2.1.1. The arbitrary Lagrangian-Eulerian viewpoint	18
2.1.2. Variations of the motion	19
2.1.3. Deformation and strain	20
2.1.4. Velocity and acceleration	24
2.1.5. Deformation rates	26
2.2. Stress measures	28
2.3. The balance laws of nonlinear elasticity	29
2.3.1. Principles of covariance for free energy functions and evolution equations	30
2.3.2. Spatial covariance of material balance of energy	32
2.3.3. The second law of thermodynamics	37
2.4. Geometric theory of finite viscoelasticity	39
2.4.1. Relation to the theory of local relaxation	40
2.4.2. Evolution equation for the inelastic metric	42
2.4.3. Cord rubber composite	45
2.5. Contact constraints	46
3. Finite element solution	49
3.1. Weak formulation of the governing equations	50
3.1.1. Balance of linear momentum with contact constraints	50
3.1.2. Internal variable evolution	53
3.1.3. The coupled problem	53
3.1.4. Relations to other works	54
3.2. Linearization	56
3.2.1. Kinematics	57
3.2.2. Stress	59
3.2.3. Follower loads	60
3.2.4. Contact contributions	61
3.2.5. The coupled problem	62
3.3. Direct elimination of the internal variable evolution equations	64
3.4. Discretization	67
3.4.1. Lowest-order energy-stabilized mean-strain elements	69
3.4.2. Contact contributions	71
3.4.3. Evolution equations	71
3.5. Computation of steady-state solutions	73
3.6. Modal analysis	74
3.6.1. Relation to a nonlinear eigenproblem and its reduced versions	75
3.6.2. Efficient numerical solution of the linearized eigenproblem	76
3.6.3. Verification	79

3.7. Computation of time-periodic solutions	84
3.7.1. Modal truncation	85
3.7.2. Fourier pseudospectral methods	86
3.7.3. Shooting method	88
4. Mesoscale model of the contact interaction and coupling to the macroscale	91
4.1. Random rough surfaces	93
4.1.1. Ergodicity assumptions	94
4.1.2. Parametrization	95
4.2. The periodic contact problem	97
4.3. Transfer to the macroscale	98
4.4. Exploration of the parameter space	100
5. Computational Results	105
5.1. Spinning cylinder	105
5.2. Full tire model	106
5.2.1. Solving for the steady-state	113
5.2.2. Solving the mesoscale contact problem	118
5.2.3. Solving for the superposed linearized dynamics	118
6. Conclusion and Outlook	125
Appendix	127
A. Tensors, differential forms and integration	127
A.1. Pull-backs and push-forwards	128
A.2. Exterior derivative and interior product	129
A.3. Connections and curvature	129
A.4. Lie differentiation	131
A.5. Transformation of volumes	132
A.6. Integration and Reynold's transport theorem	132
A.6.1. The theorem of Stokes	133
A.6.2. Transformation of areas	134
B. Tensor identities	137
B.1. Functions of tensors	137
B.2. Identity tensors of fourth order	138
C. Compatibility conditions for the deformation gradient	141
D. Linearization of the particle acceleration	143
Bibliography	147
